What H_0 tells us

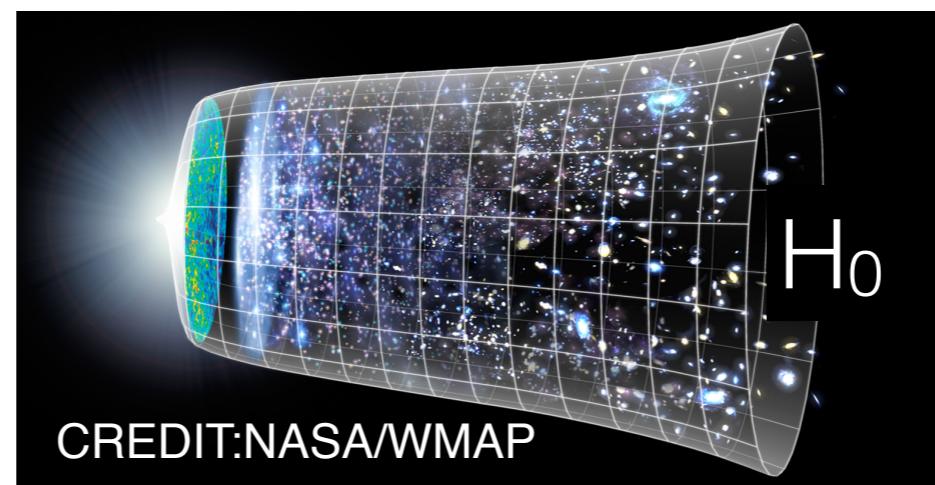

H_0 : normalisation of the Hubble parameter $H(z)$ that describes the current expansion rate of the Universe

1970: Allan Sandage described cosmology as the search for two numbers:

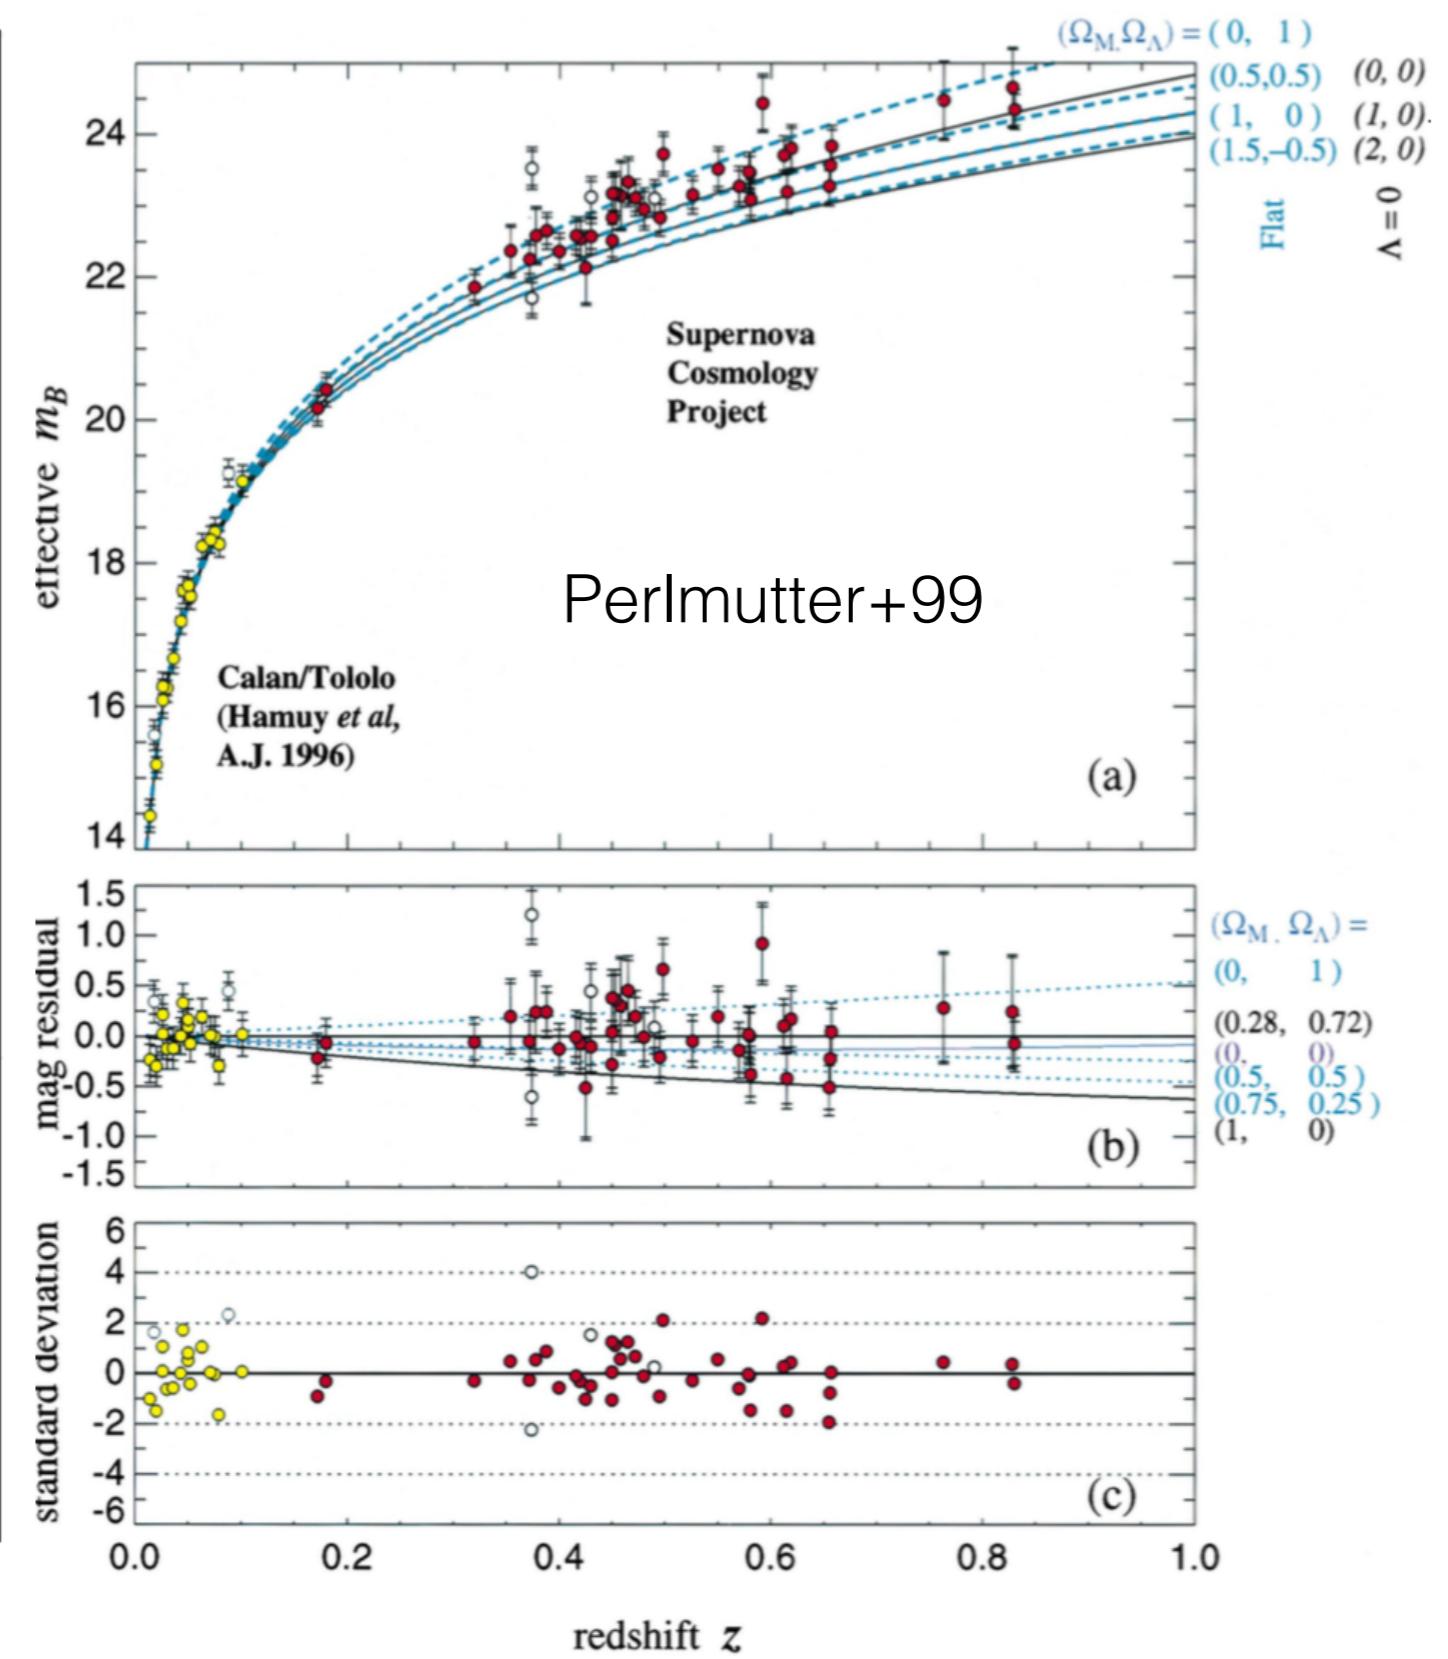

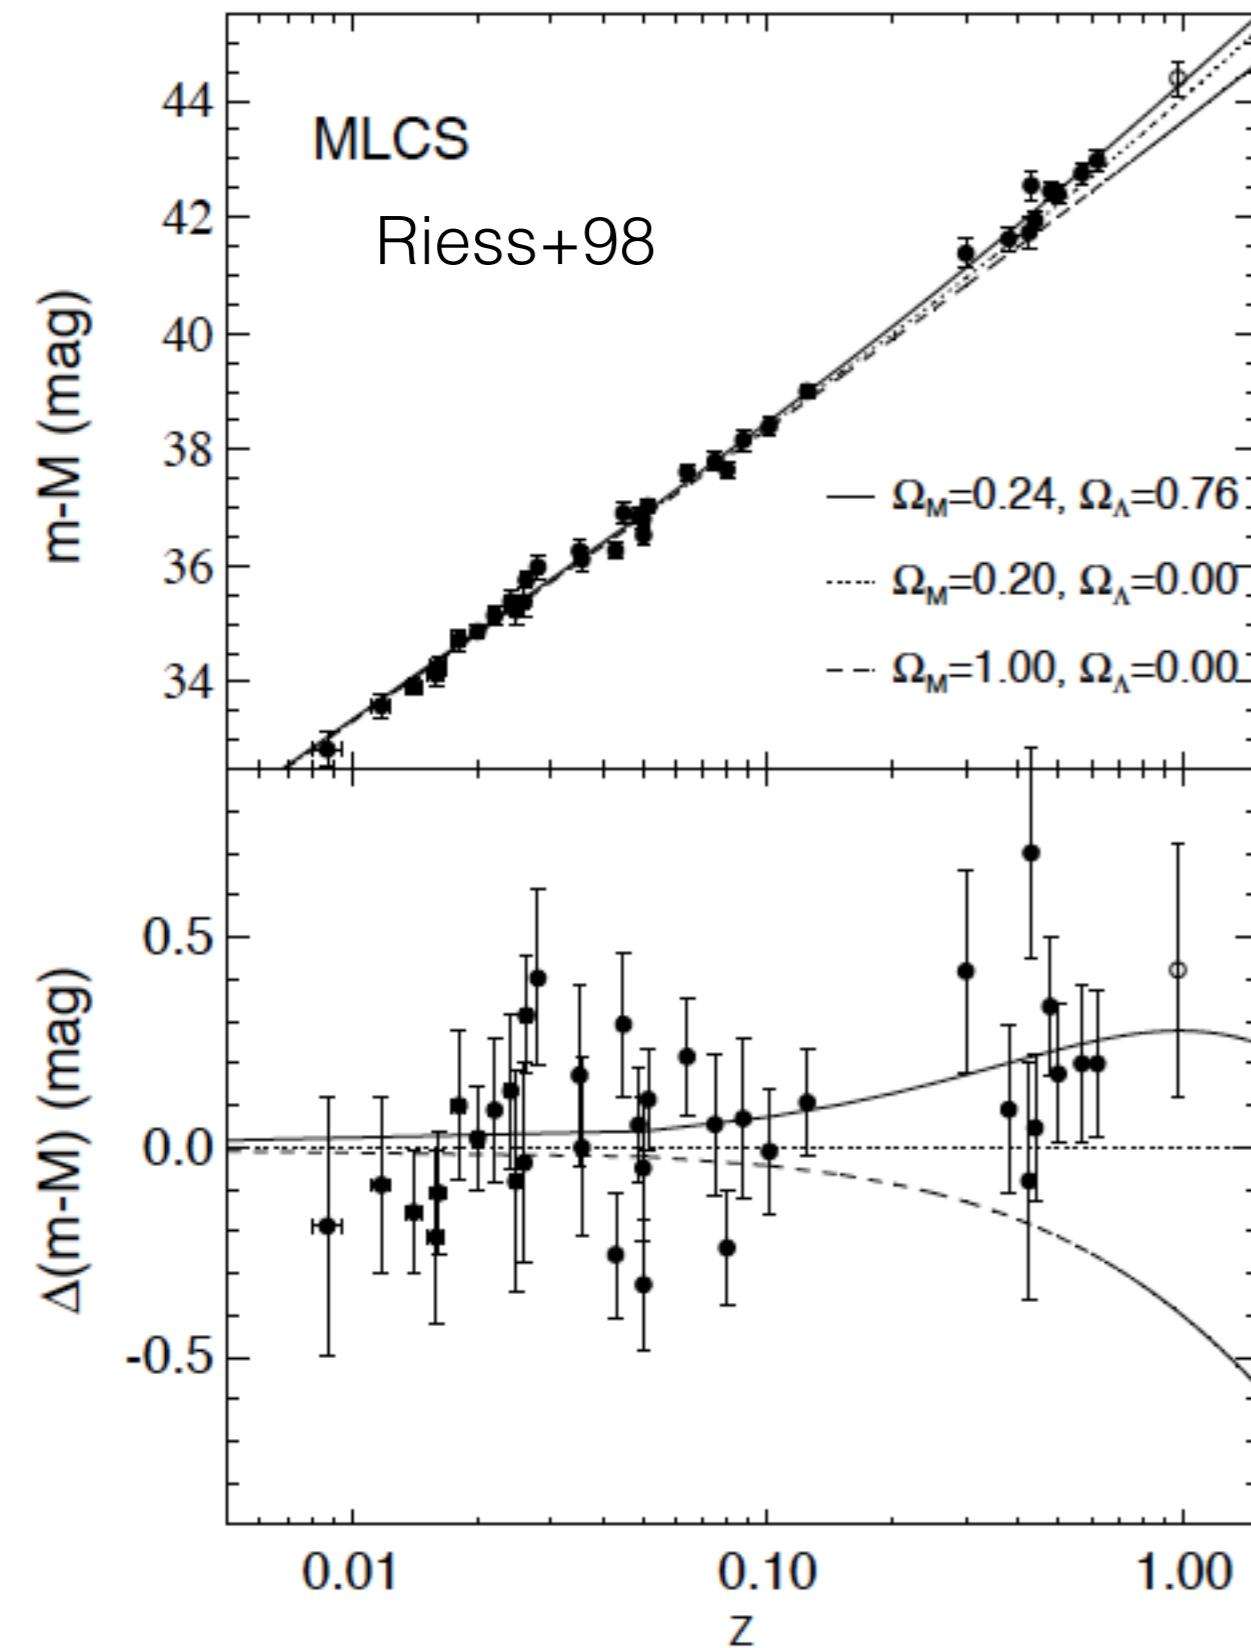

1. the current rate of expansion (H_0)
2. the deceleration/acceleration of the expansion (q_0)

q_0 is directly connected to the energy content of the Universe: discovery that $q_0 < 0$, i.e., expansion rate is increasing with time (Riess+98; Perlmutter+99).

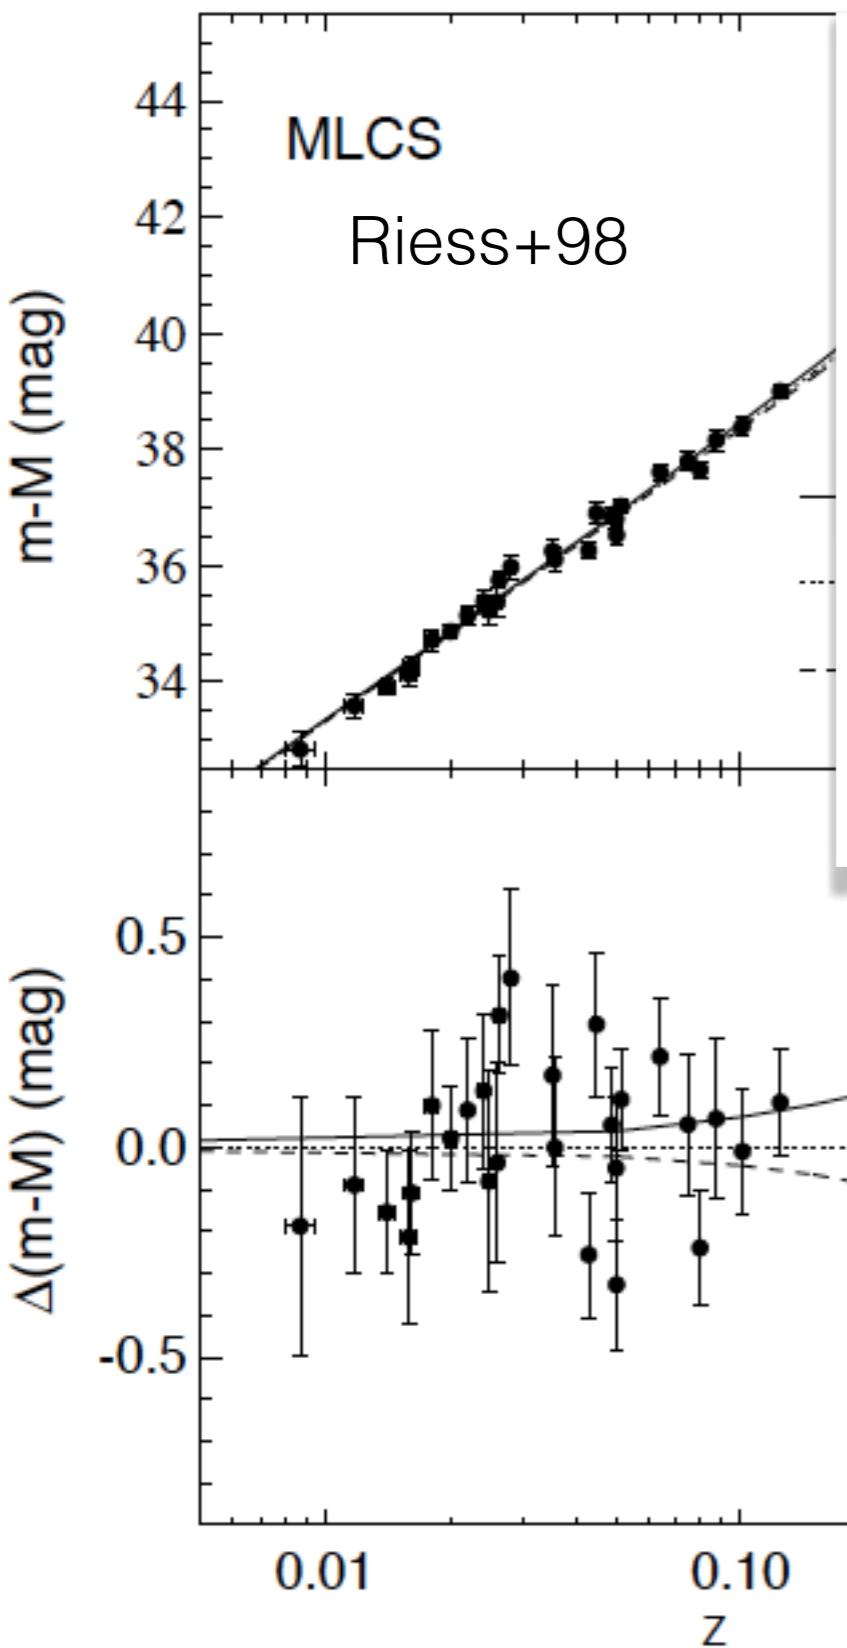

H_0 inv. prop. to distances and age of the Universe: recently also important for measuring the energy content of the Universe (WMAP, Planck collaboration).

Adam G. Riess
Prize share: 1/4

The Nobel Prize in Physics 2011 was divided, one half awarded to Saul Perlmutter, the other half jointly to Brian P. Schmidt and Adam G. Riess "for the discovery of the accelerating expansion of the Universe through observations of distant supernovae".

What H_0 tells us

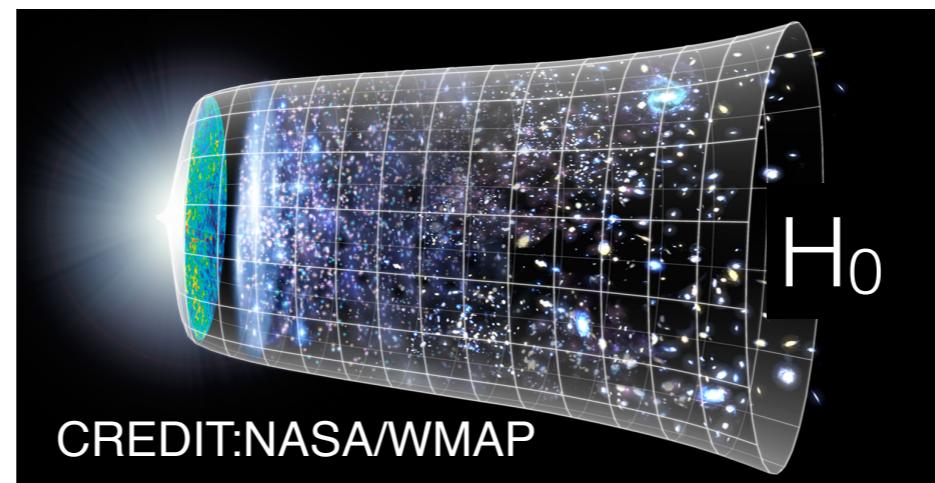

H_0 : normalisation of the Hubble parameter $H(z)$ that describes the current expansion rate of the Universe

1970: Allan Sandage described cosmology as the search for two numbers:

1. the current rate of expansion (H_0)
2. the deceleration/acceleration of the expansion (q_0)

q_0 is directly connected to the energy content of the Universe: discovery that $q_0 < 0$, i.e., expansion rate is increasing with time (Riess+98; Perlmutter+99).

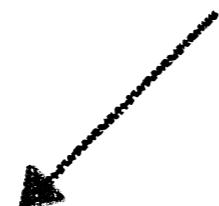

H_0 inv. prop. to distances and age of the Universe: recently also important for measuring the energy content of the Universe (WMAP, Planck collaboration).

The schism between early & late Universe

Shah, Lemos and Lahav (2021, arXiv2109.01161)

H_0 can be measured

Locally: parallax, Type Ia supernovae, cosmic clocks, quasar strong lensing, GW

$z \sim 1100$: angle subtended by the sound horizon as observed in CMB temperature fluctuations

Riess et al. (2021)
 $H_0 = 73.2 \pm 1.3 \text{ km s}^{-1} \text{ Mpc}^{-1}$

Planck et al. (2018)
 $H_0 = 67.4 \pm 0.5 \text{ km s}^{-1} \text{ Mpc}^{-1}$

4σ tension

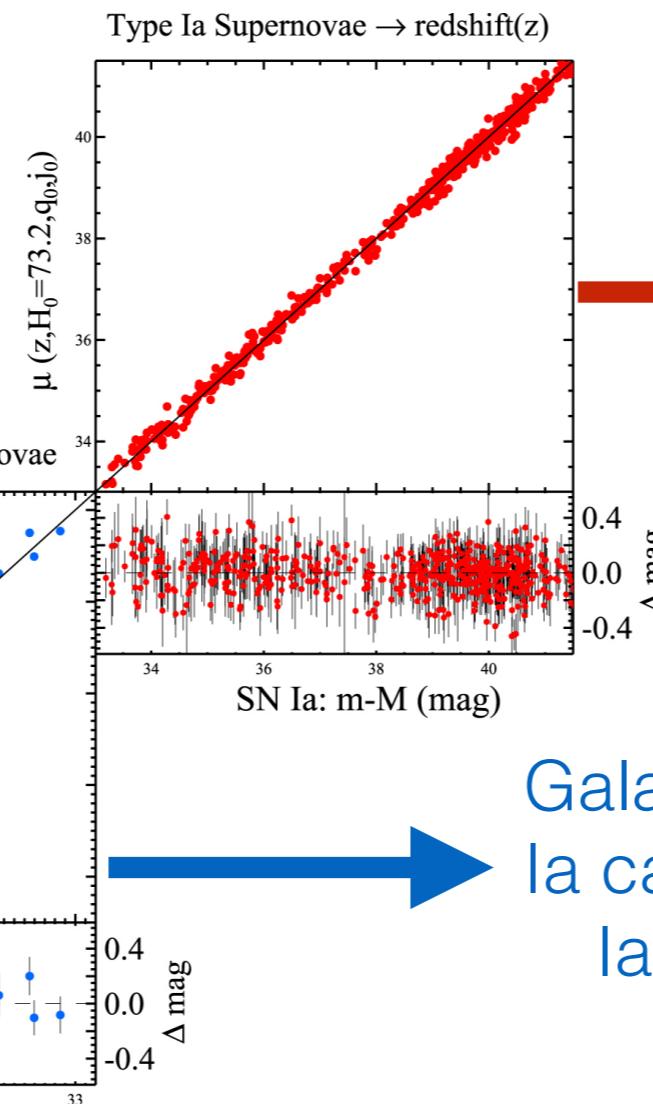

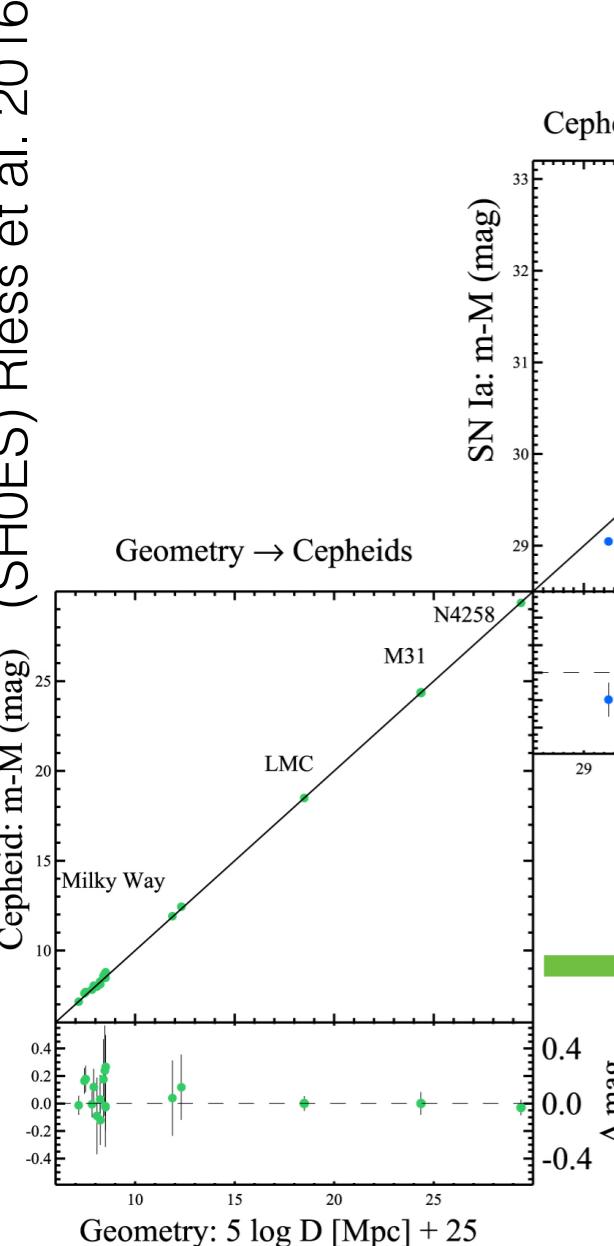

Significant enough to warrant new physics?

estimates of H_0 at the 1% level and from cosmological tools at different redshifts are needed to decisively answer this question! The race has started...

Measure H_0 locally: build the distance ladder

$$H_0 = c \frac{z}{d} + v_p$$

(SHOES) Riess et al. 2016

Redshifts of SN Ia + intrinsic and observed magnitudes (distance modulus): H_0

Galaxies with both Cepheids and SN Ia calibrate intrinsic brightness of SN Ia (19 sources, Riess et al 2016)

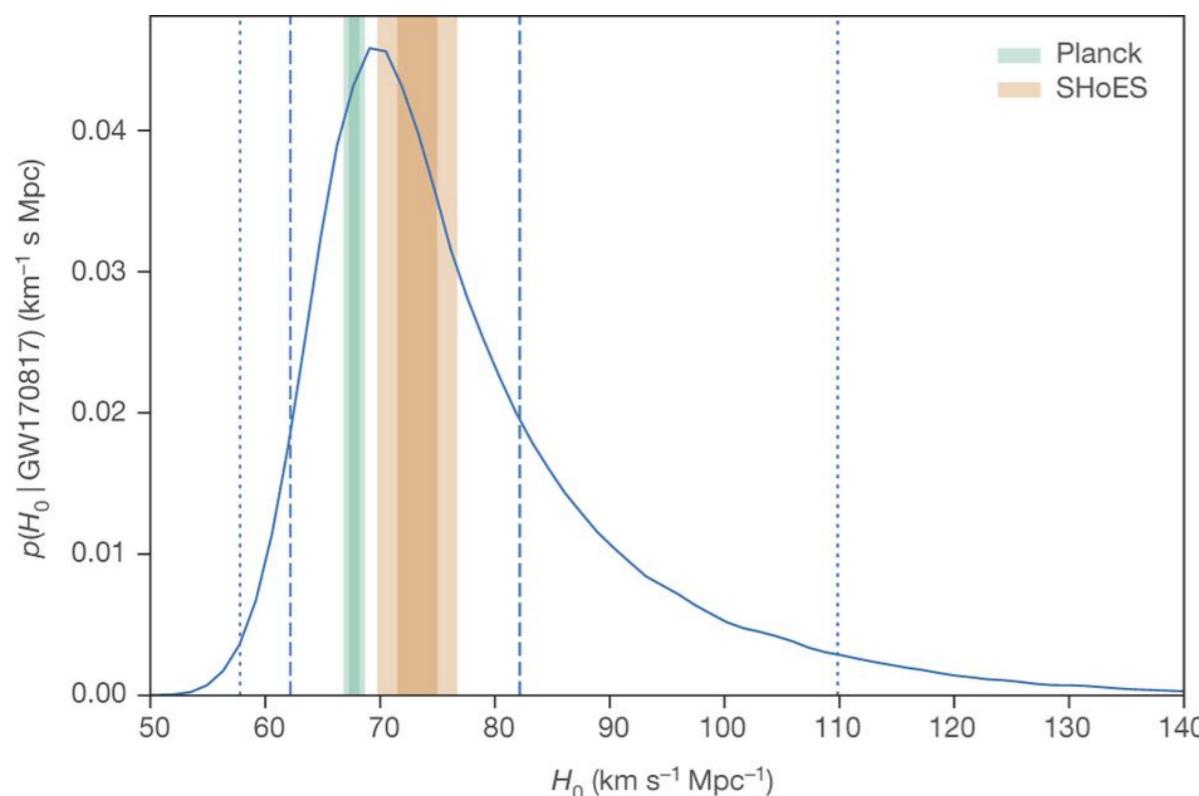

Parallaxes (geometric distances) calibrate the intrinsic brightness of Cepheids (variable stars, P-L relation)

Hubble law is not that simple:
peculiar velocities (reliable z only at high distances)
measure distances only nearby (parallax)

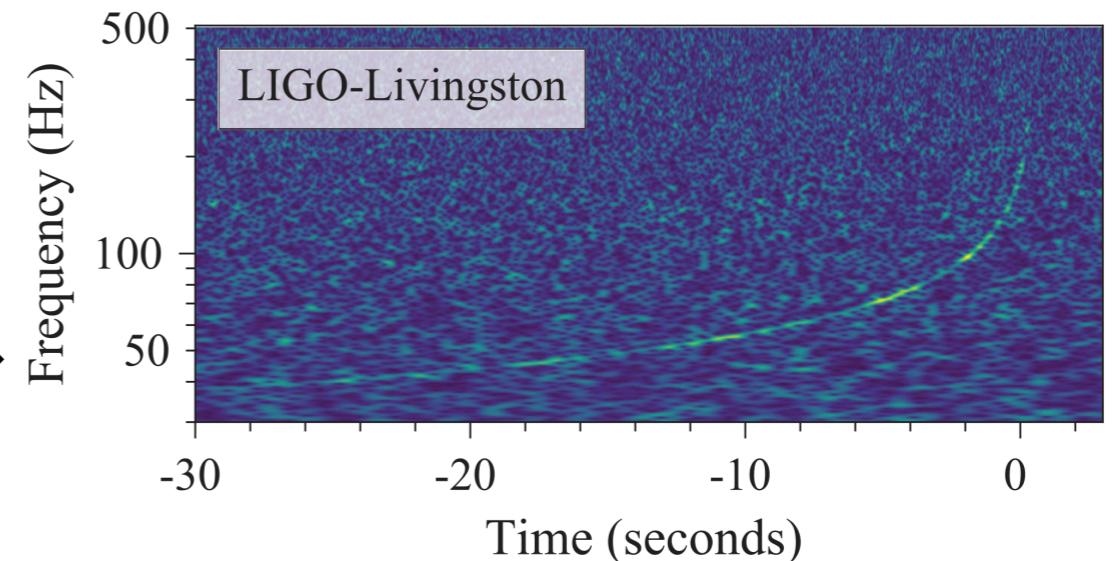

Measure H_0 locally: neutron star binary merger

Measure distance from gravitational wave

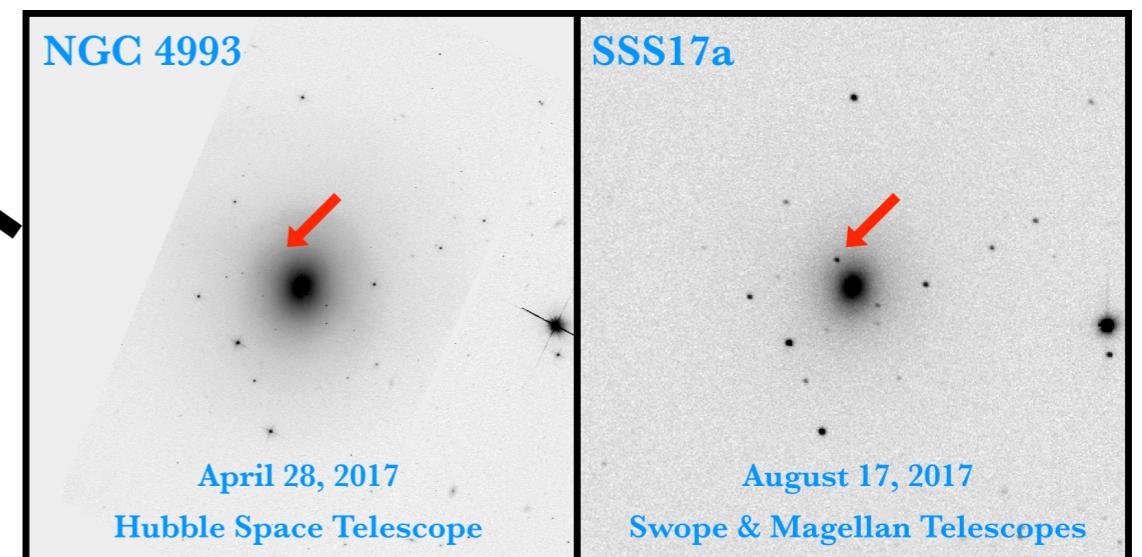

$$H_0 = c z/d$$

Abbott et al. 2017, Nat., 551-85A

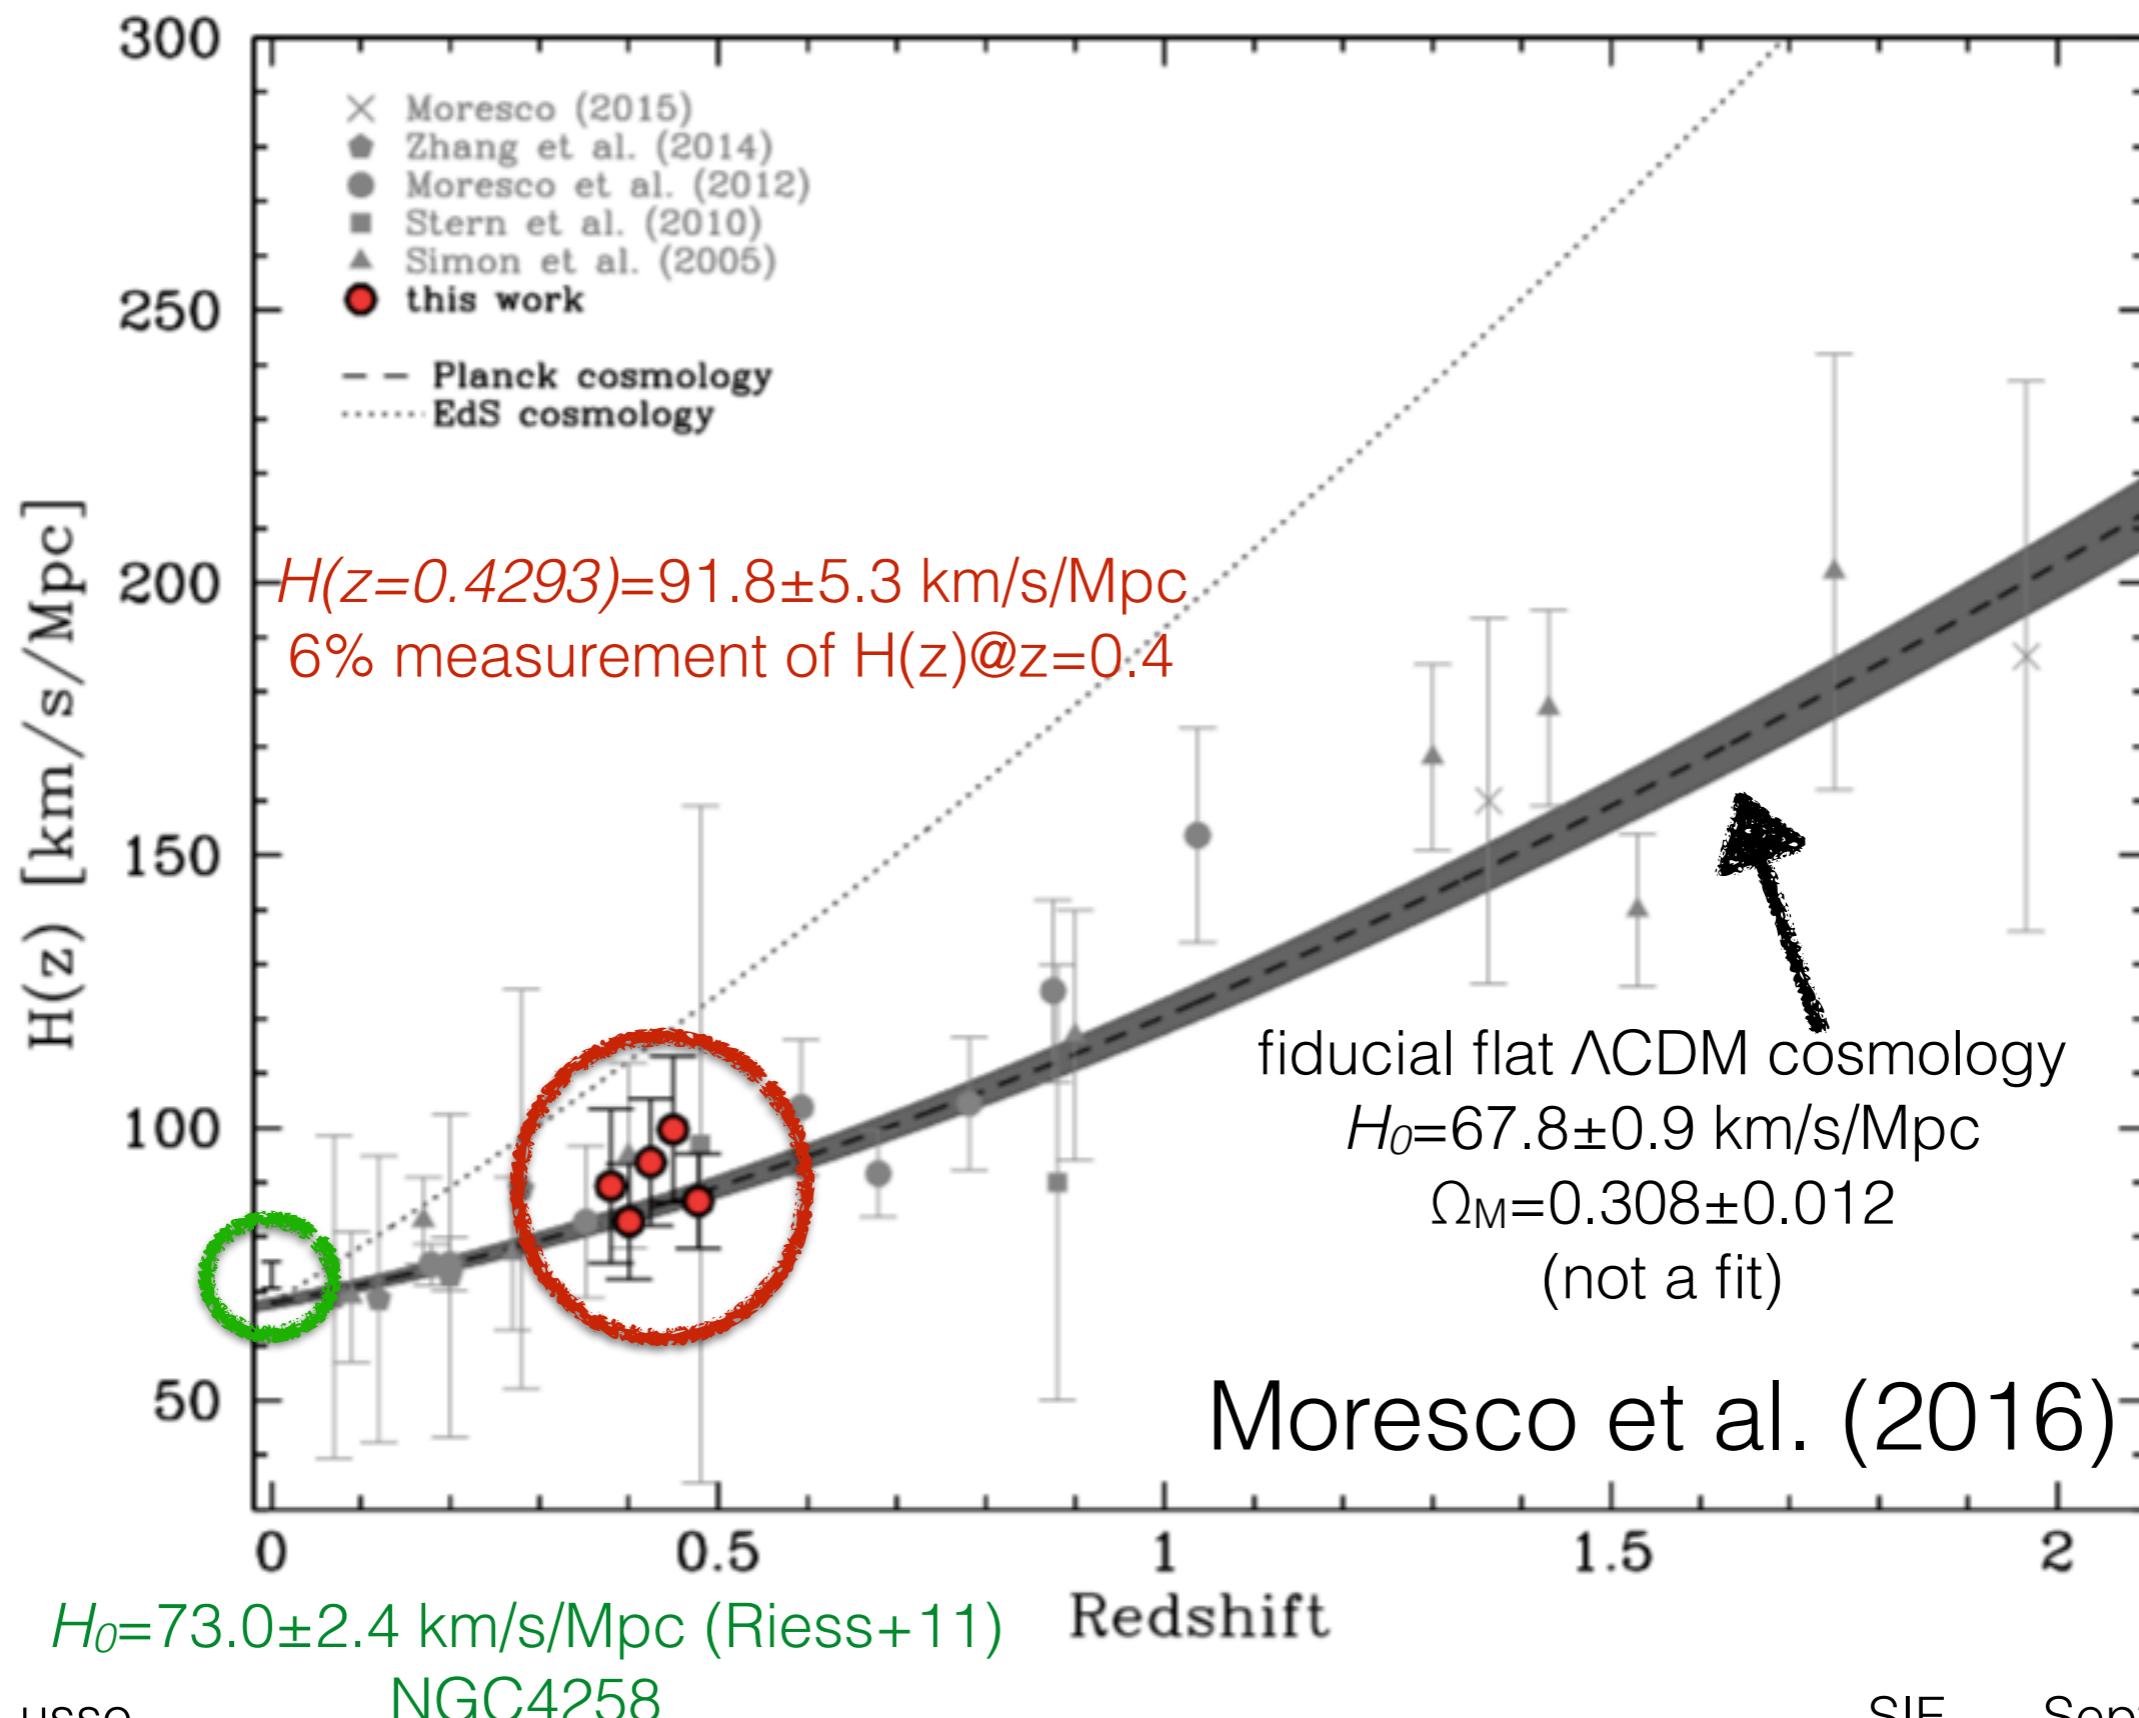

Measure redshift of the e.m. counterpart

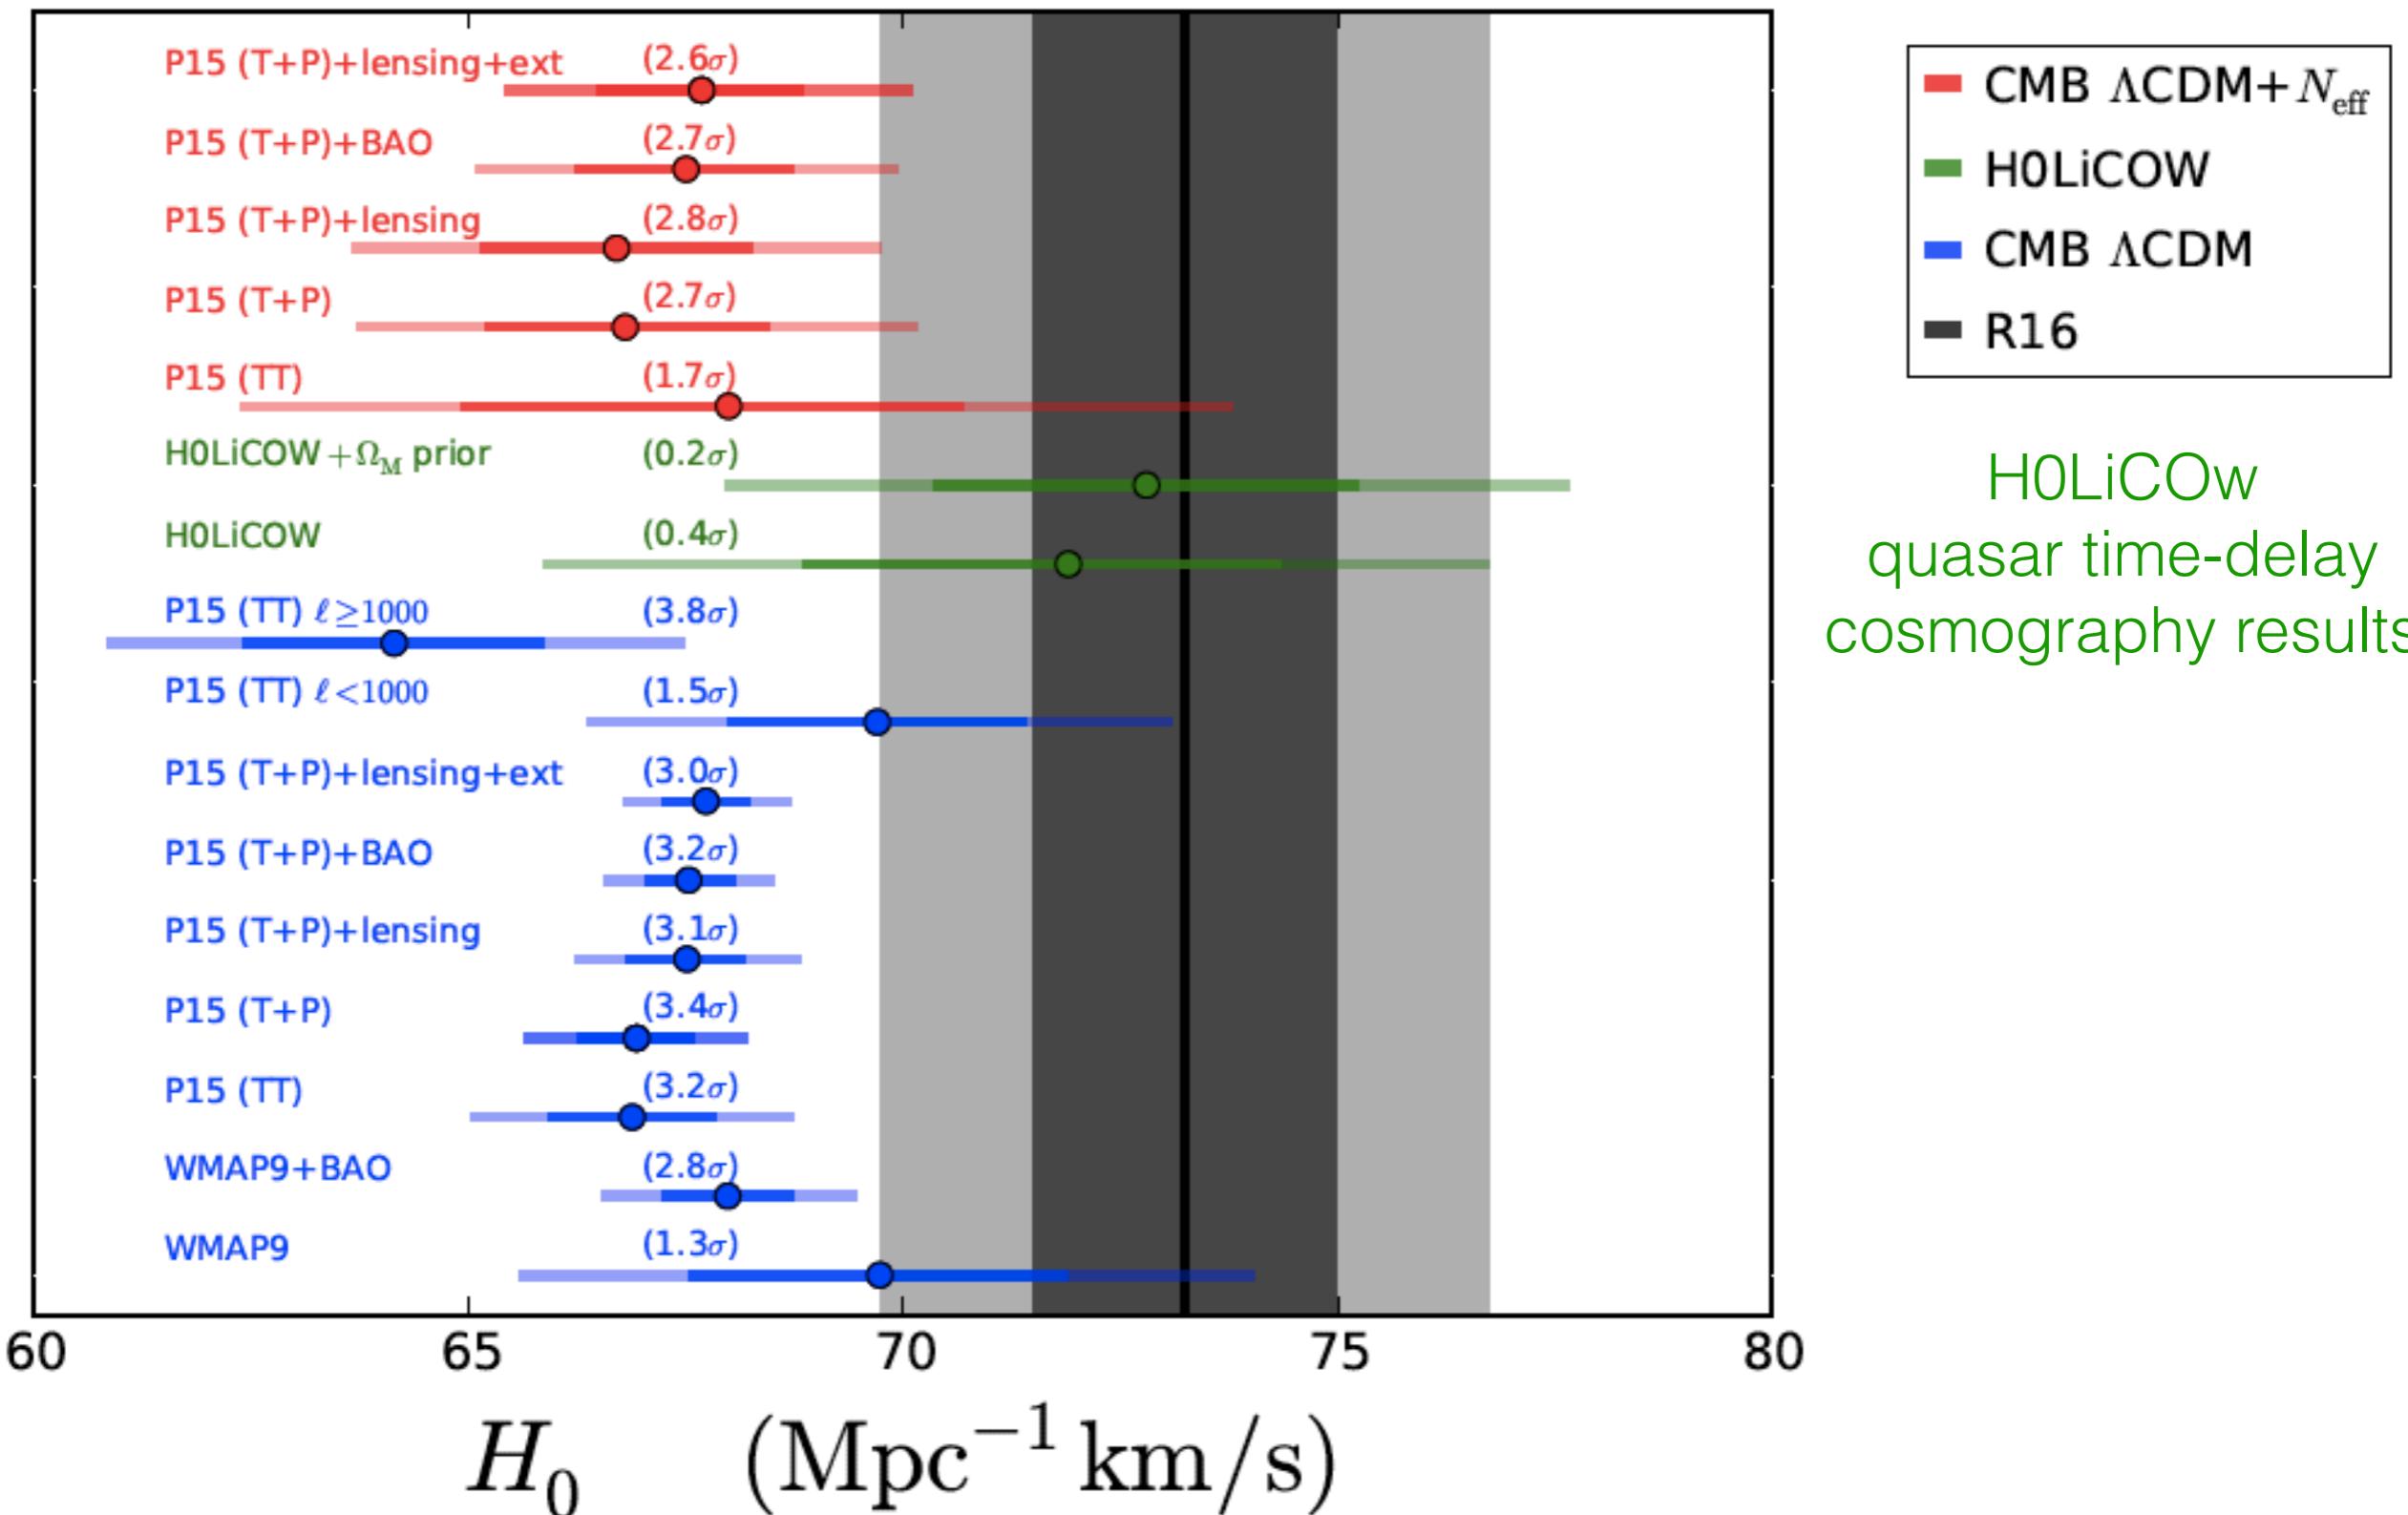

GW170817 measurement of H_0 (LIGO–Virgo collaboration): only assumes GR

Measure $H(z)$: Cosmic clocks

LIGHT FROM A BLACK HOLE: QUASAR

Cosmology with quasars

The distance modulus

Lusso & Risaliti (2016, ApJ, 819-154)

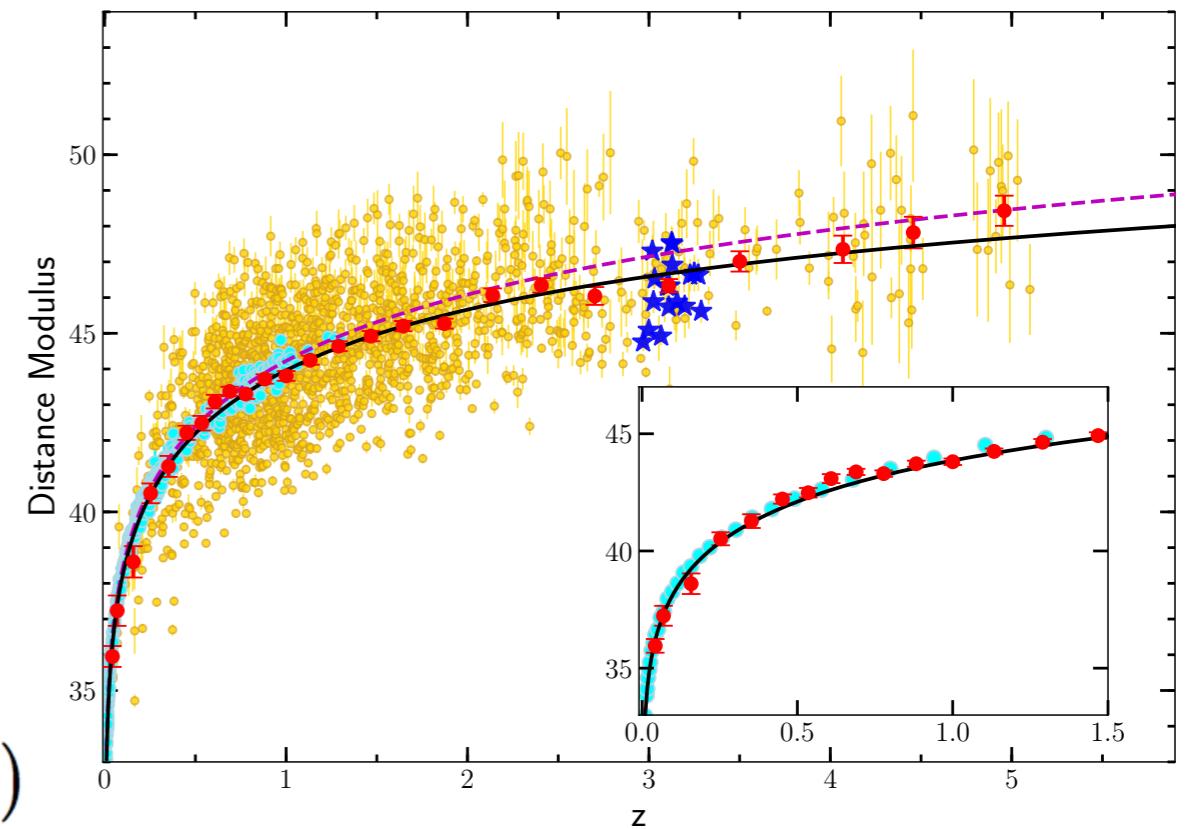

Standardise the quasar emission

$$\begin{aligned} \log(F_X) &= \Phi(F_{UV}, D_L) \\ &= \beta' + \gamma \log(F_{UV}) + 2(\gamma - 1)\log(D_L) \\ &\quad D_L(z, \Omega_M, \Omega_\Lambda) \end{aligned}$$

$$\log(L_X) = \beta + \gamma \log(L_{UV})$$

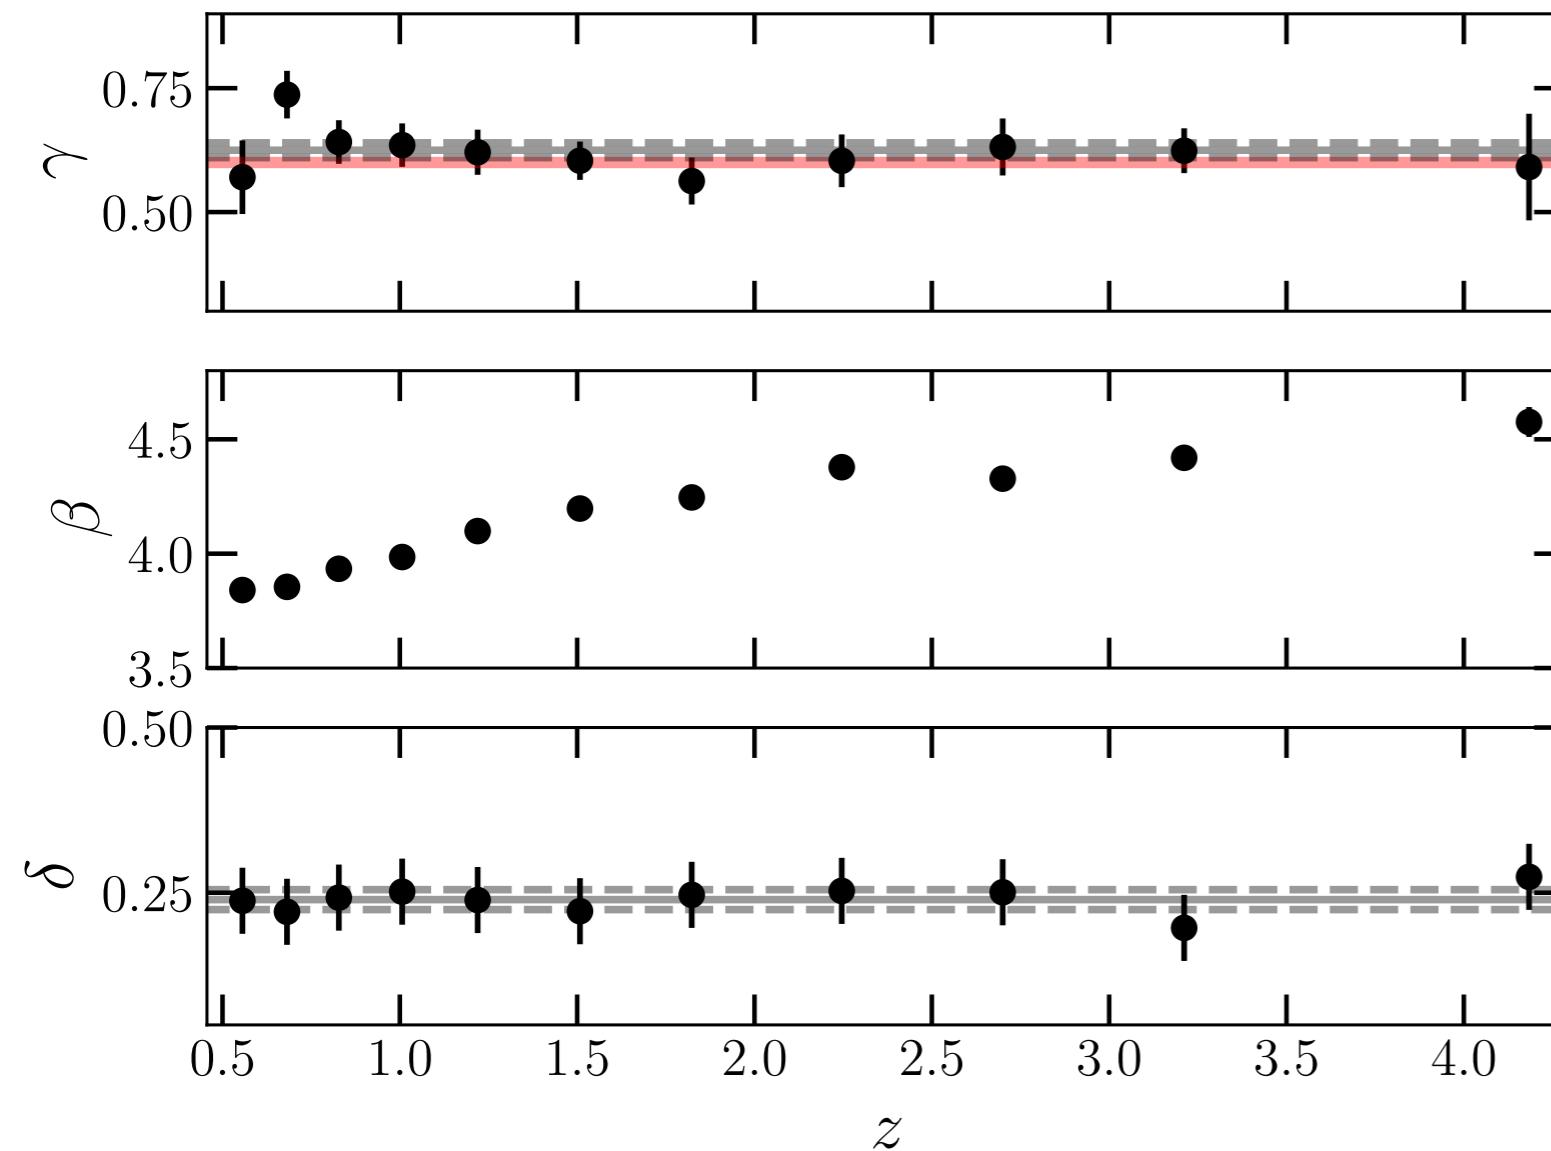

Risaliti & Lusso (2019, *Nat. Astro.*)

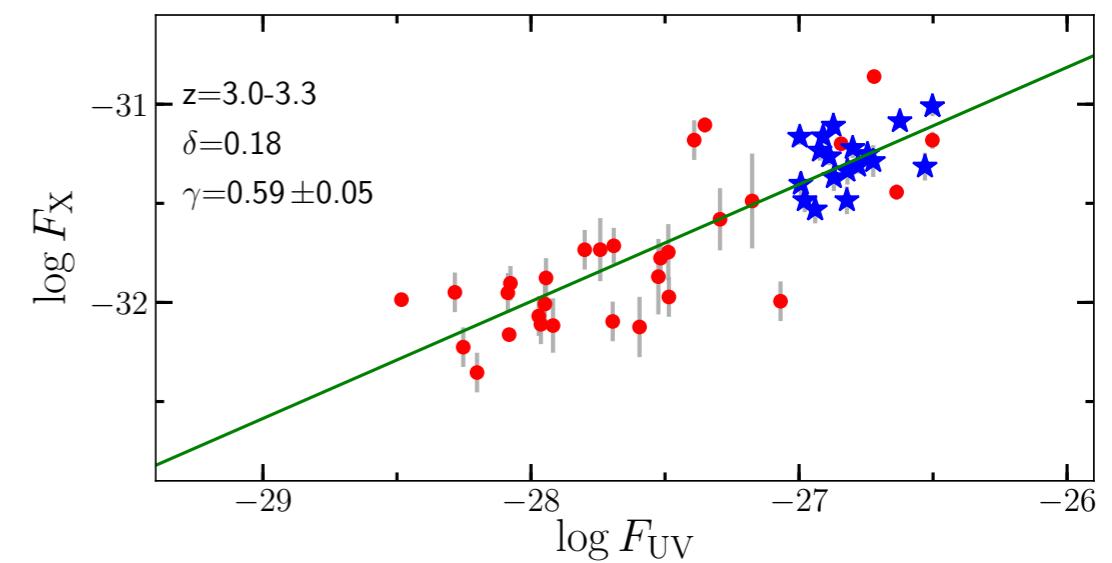

The L_x-L_{UV} non-linear relation as a way to measure quasar distances

Cosmology with quasars

Quasars Hubble Diagram: redshift dependence

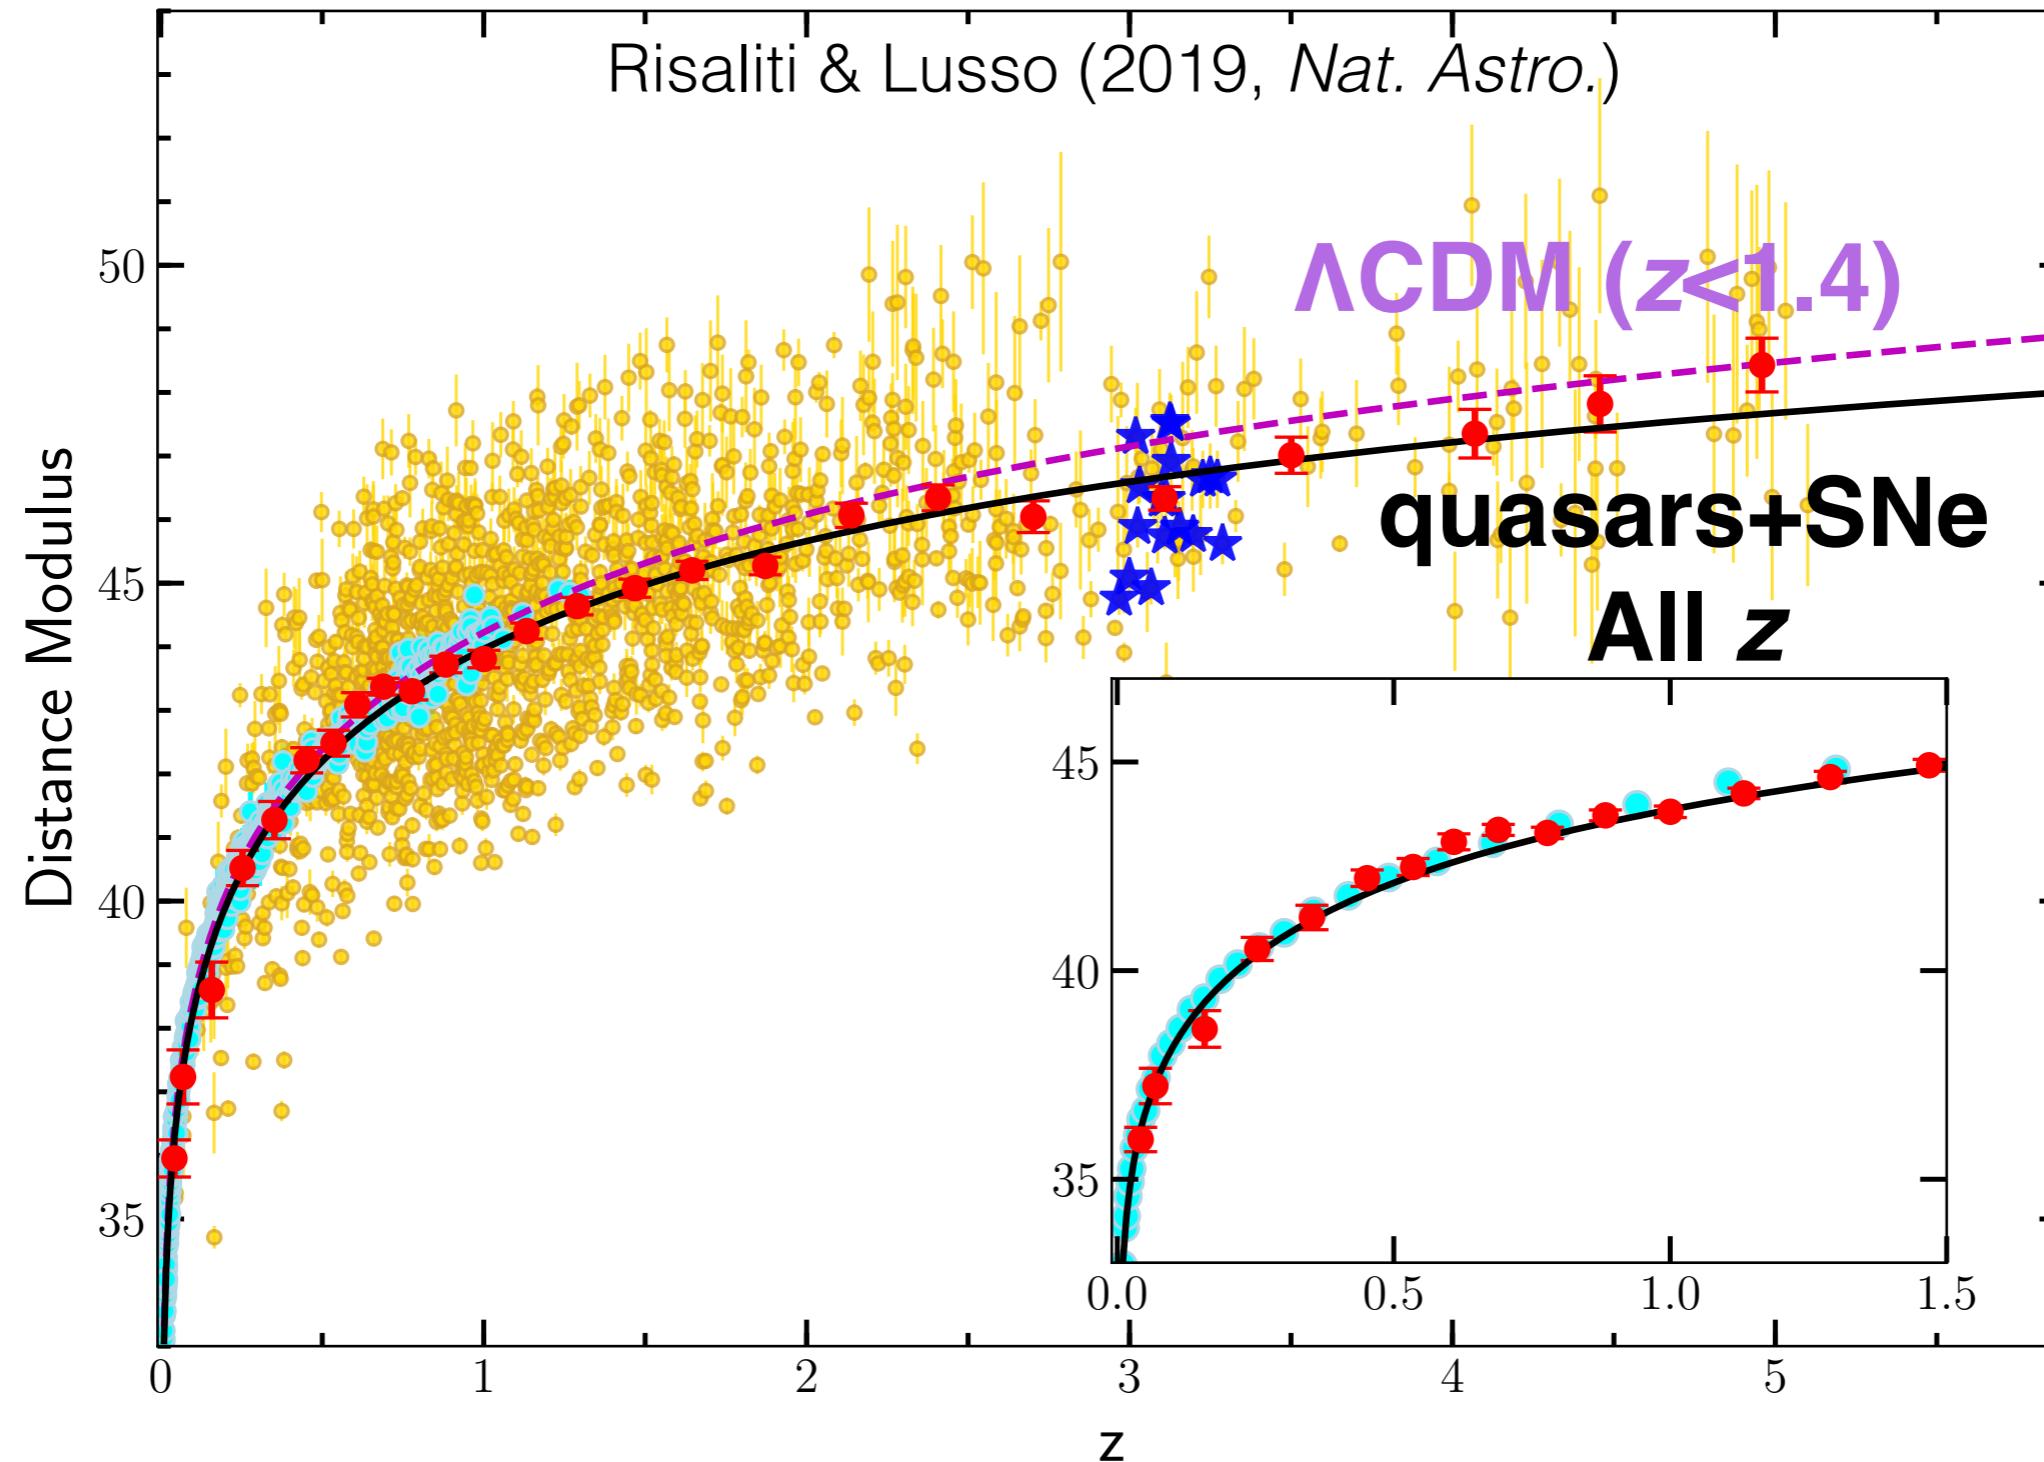

$$\log D_L = \frac{1}{2-2\gamma} (\gamma \log F_{UV} - \log F_X) + \beta.$$

Cosmology with quasars

Quasars Hubble Diagram

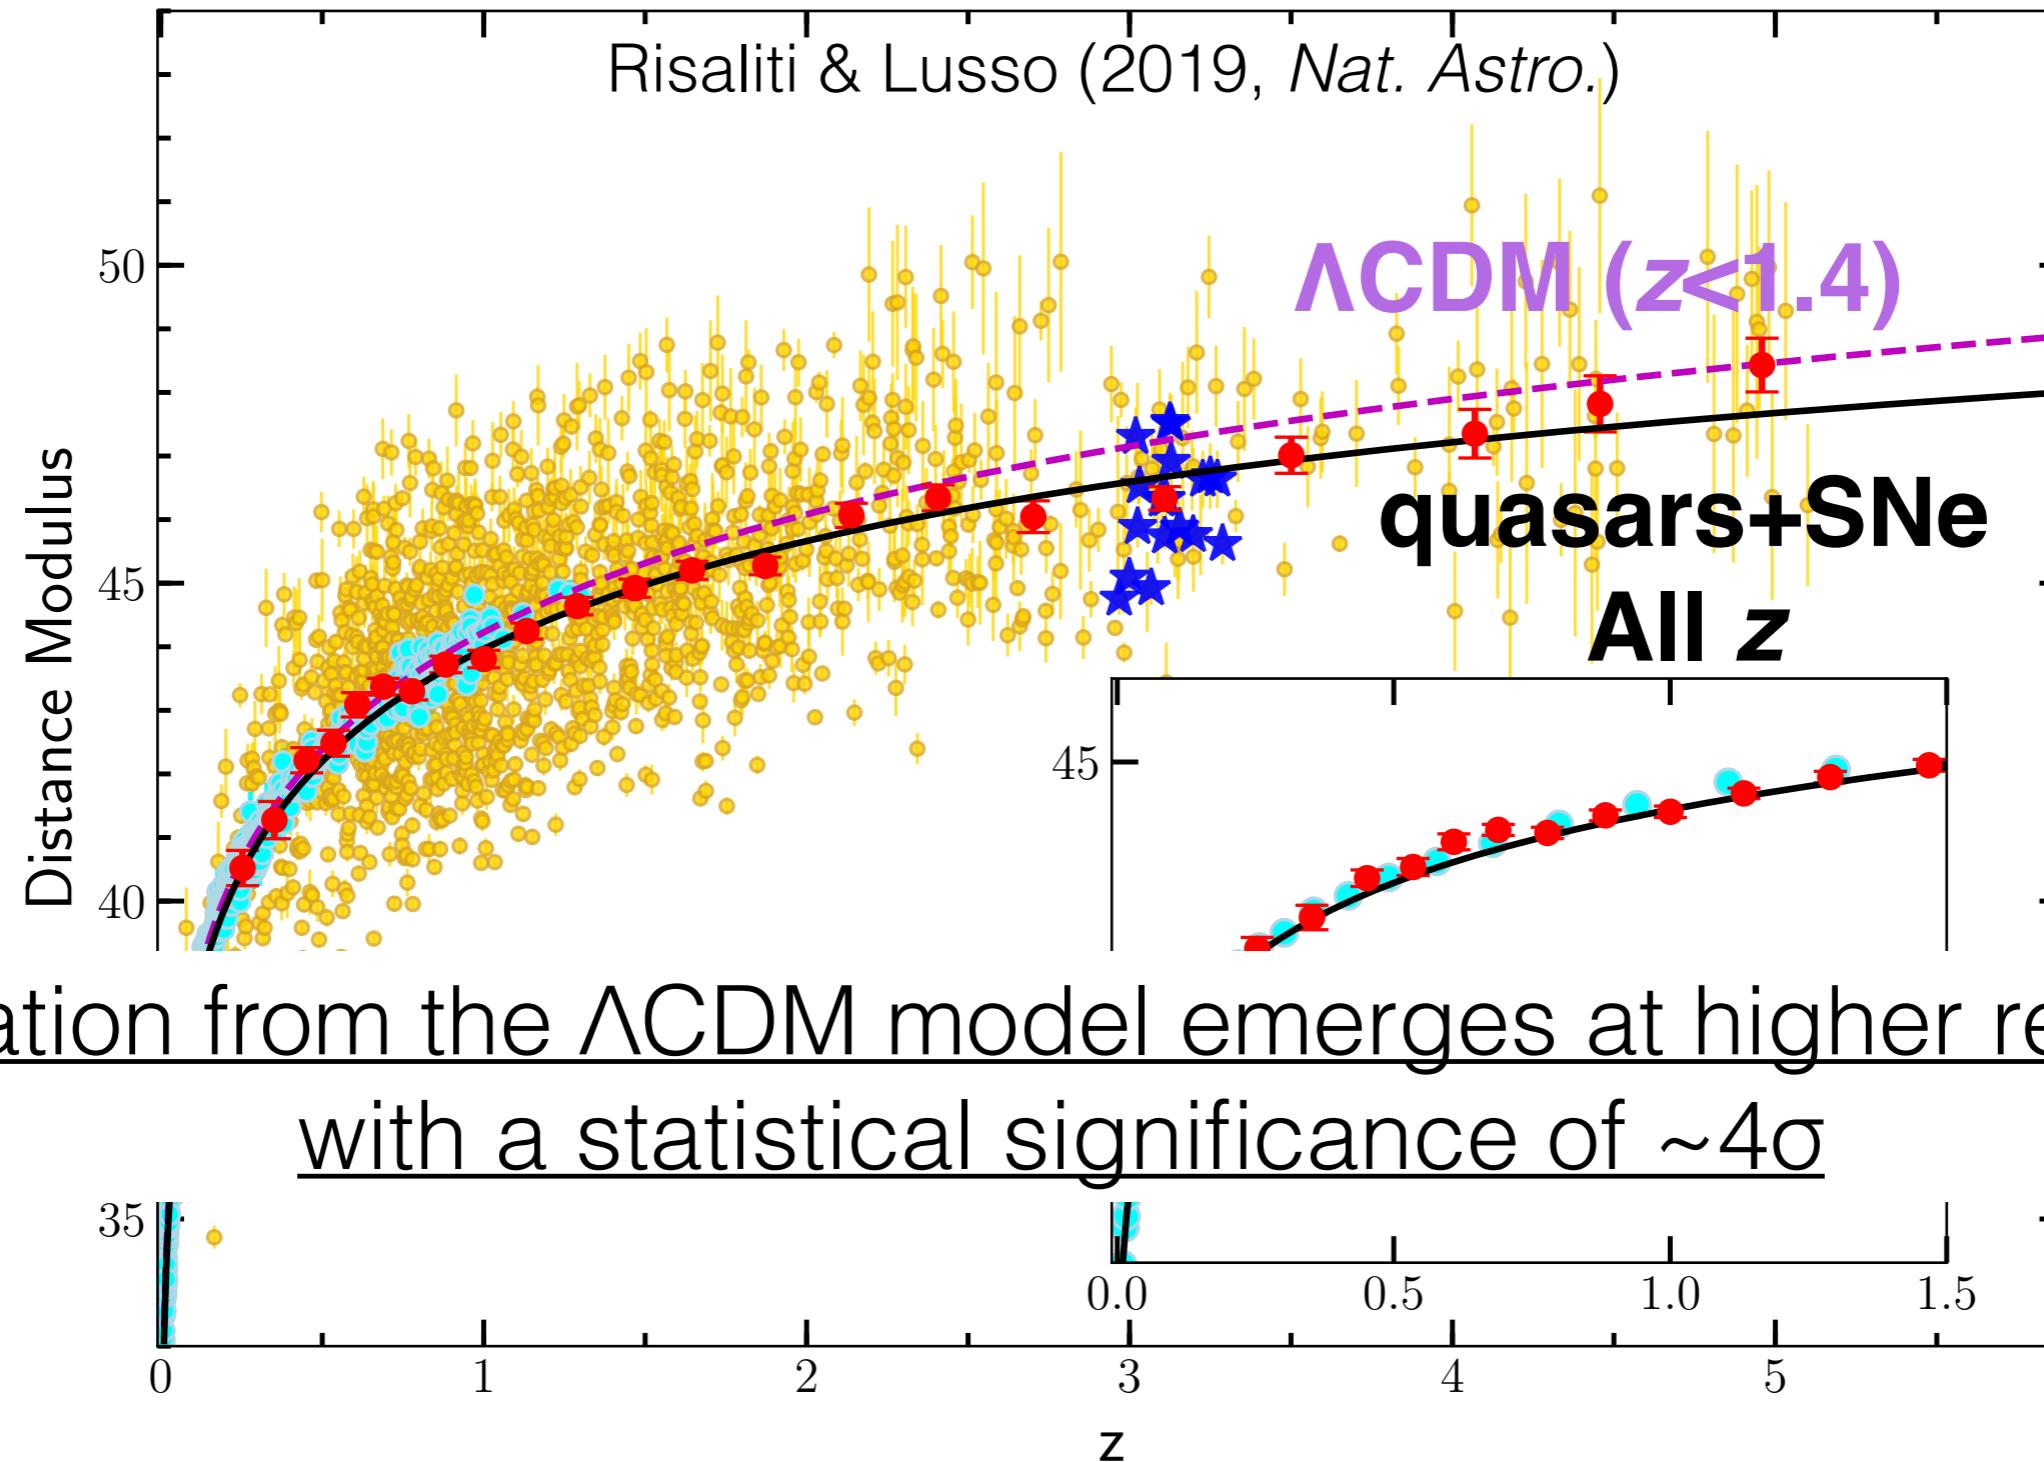

~1600 quasars: SDSS+3XMM+XMM LP+archive/literature

Cosmology with quasars

Quasars Hubble Diagram

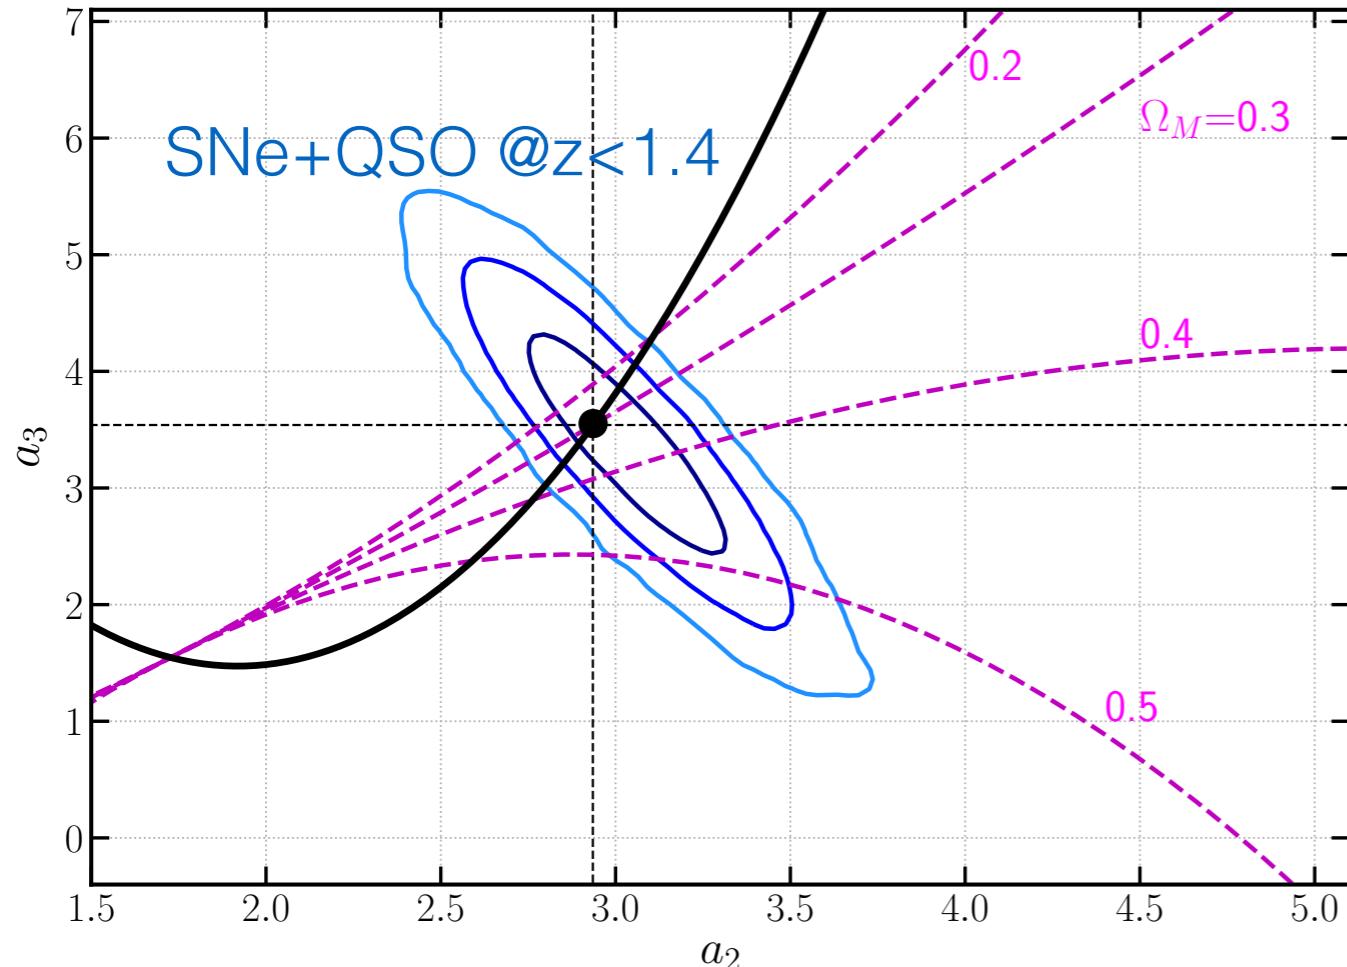

~1600 quasars: SDSS+3XMM+XMM LP+archive/literature

Cosmology with quasars

Quasars Hubble Diagram

Risaliti & Lusso (2019, *Nat. Astro.*)

Cosmographic approach

$$P[\log(1+z)]: D_L = k \sum_i a_i [\log(1+z)]^i$$

$$k = \ln(10)c/H_0$$

$$a_2(\Omega_M), a_3(\Omega_M)$$

— Flat Λ CDM

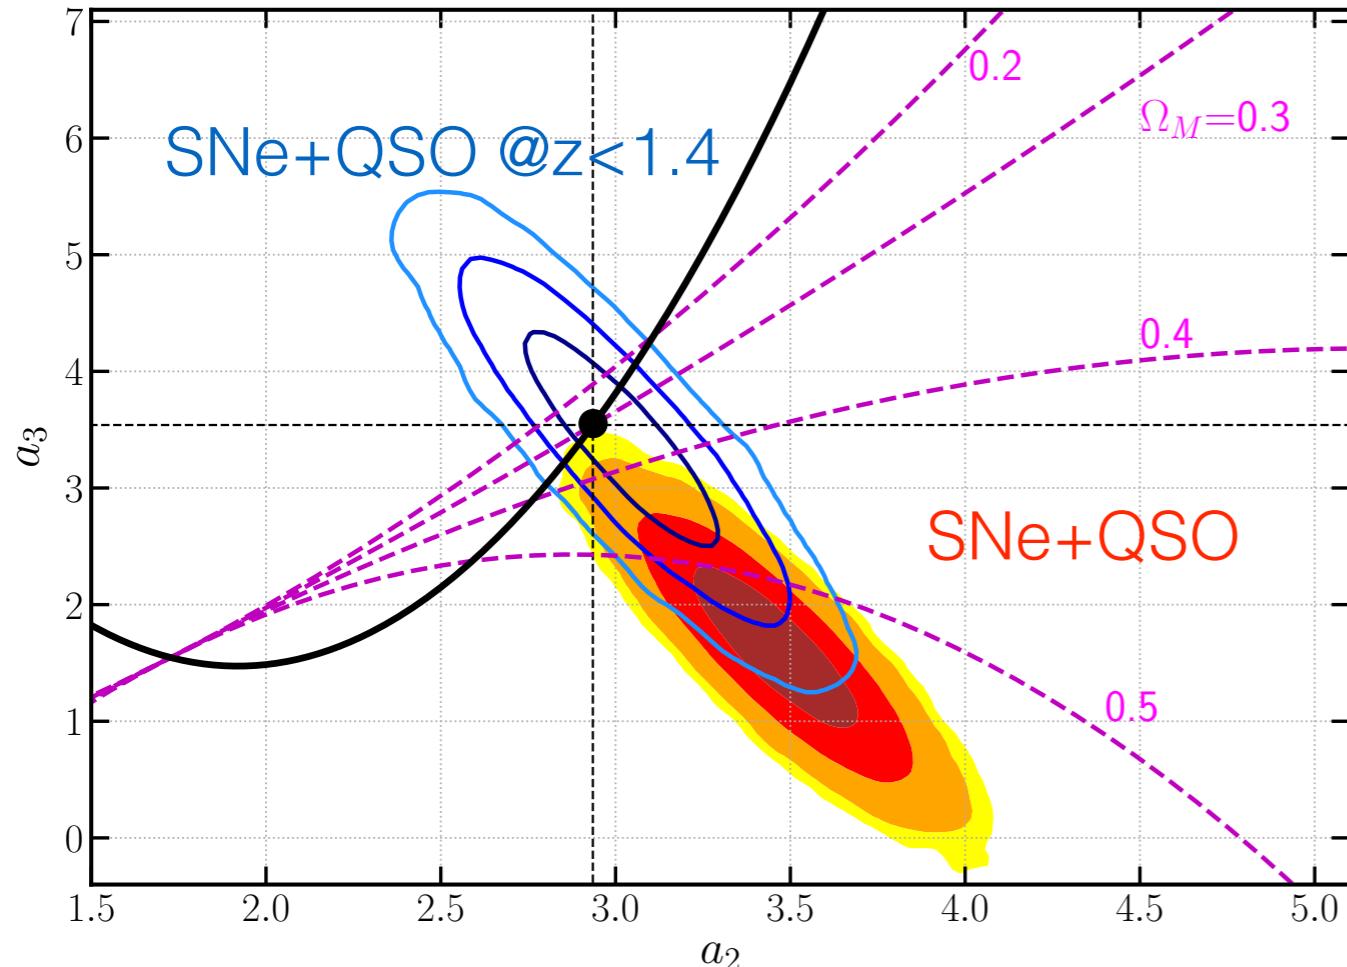

- - - Flat w CDM (free w)

Intersections magenta lines and black curve are the points with $w=1$ (left) and $w=-1$ (right), values of w decrease from left to right

Cosmology with quasars

Quasars Hubble Diagram

Risaliti & Lusso (2019, *Nat. Astro.*)

Cosmographic approach

$$P[\log(1+z)] : D_L = k \sum_i a_i [\log(1+z)]^i$$

$$k = \ln(10)c/H_0$$

$$a_2(\Omega_M), a_3(\Omega_M)$$

— Flat Λ CDM

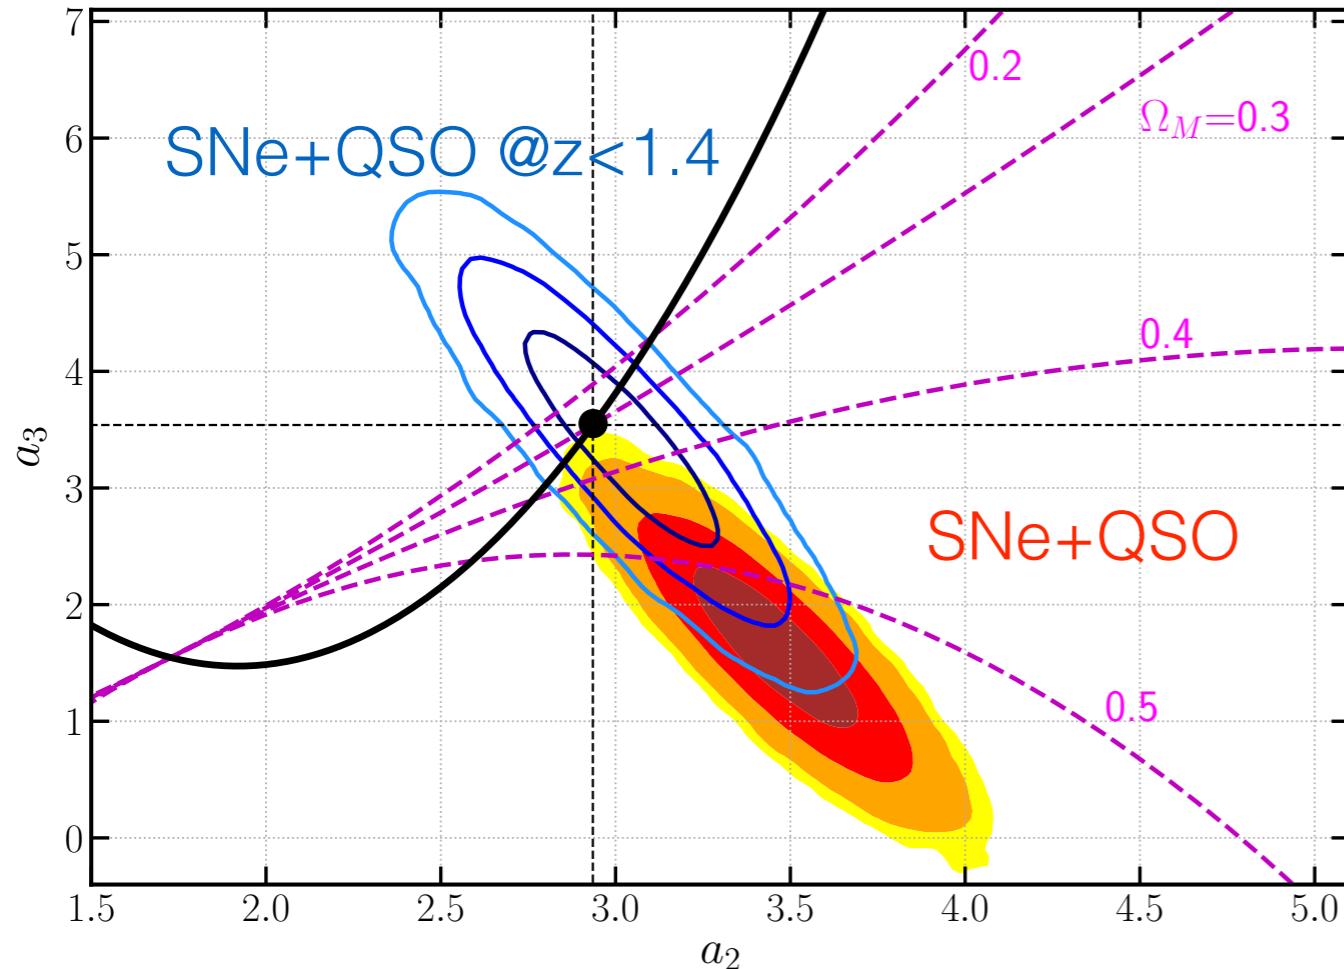

- - - Flat w CDM (free w)

Intersections magenta lines and black curve are the points with $w=1$ (left) and $w=-1$ (right), values of w decrease from left to right

Cosmology with quasars

Quasars Hubble Diagram

Risaliti & Lusso (2019, *Nat. Astro.*)

Cosmographic approach

$$P[\log(1+z)] : D_L = k \sum_i a_i [\log(1+z)]^i$$

$$k = \ln(10)c/H_0$$

$$a_2(\Omega_M), a_3(\Omega_M)$$

— Flat Λ CDM

- - - Flat w CDM (free w)

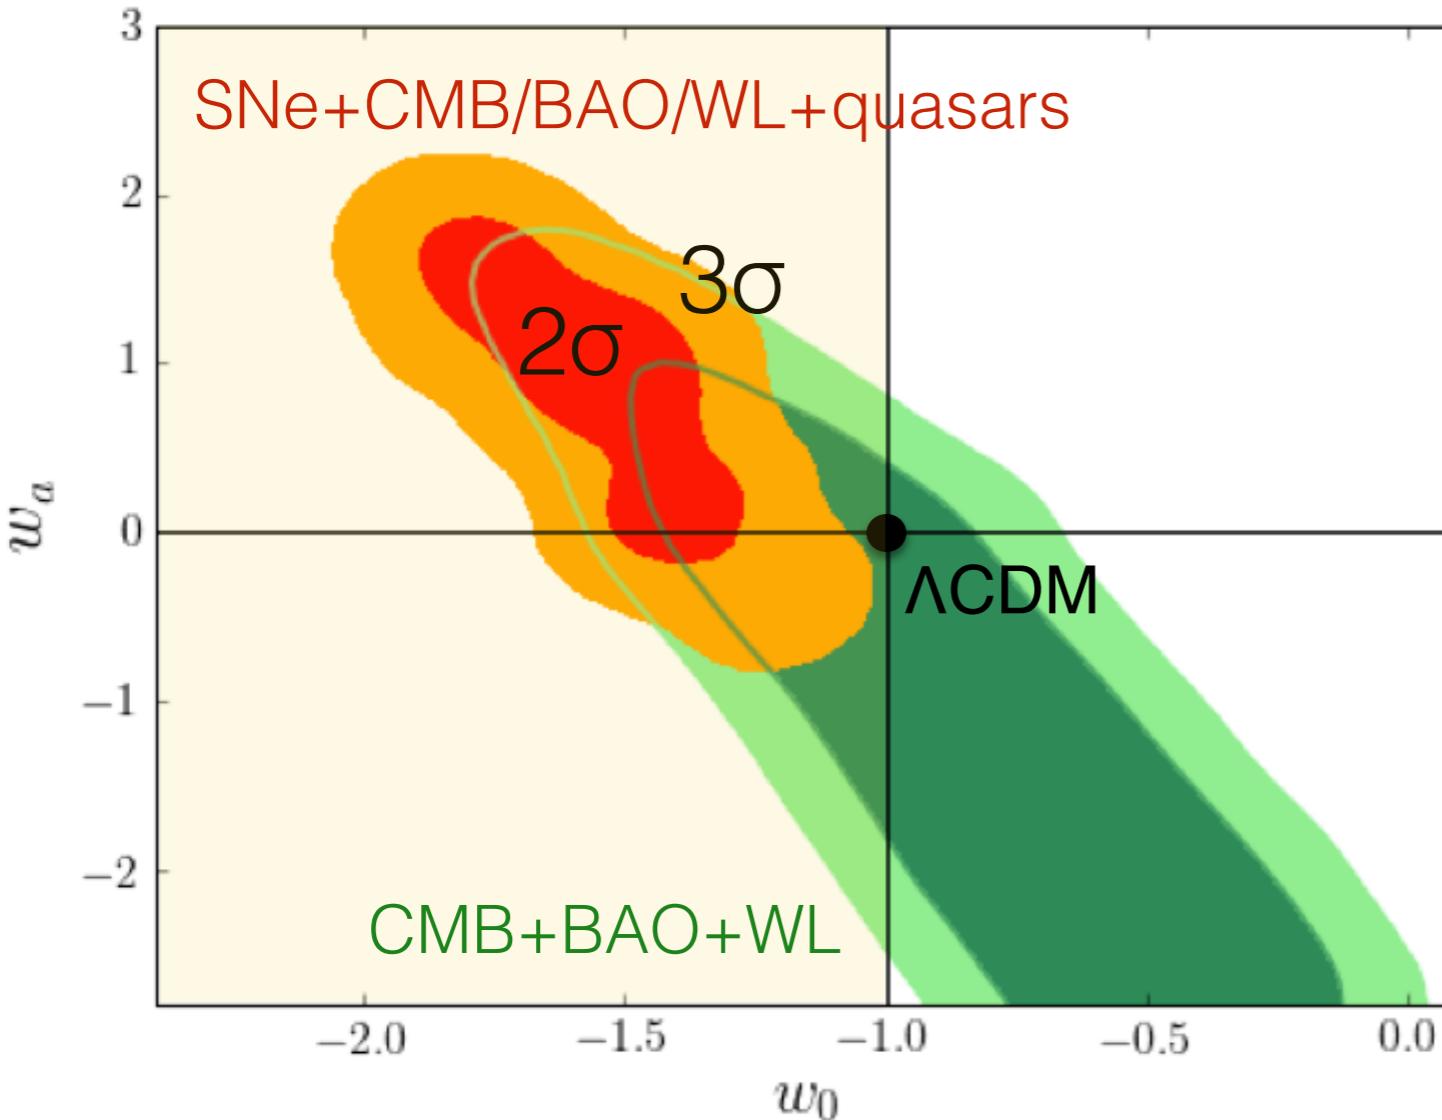

Intersections magenta lines and black curve are the points with $w=1$ (left) and $w=-1$ (right), values of w decrease from left to right

data suggest: **dark energy density increasing with time.**

Within the w CDM model: $\Omega_M > 0.3$ and $w < -1.3$

Cosmology with quasars: Λ CDM crises?

Risaliti & Lusso (2019, *Nat. As.*, 3-272)

Flat w CDM (free w)

$$w(z) = w_0 + w_a z / (1+z)$$

Distance Modulus

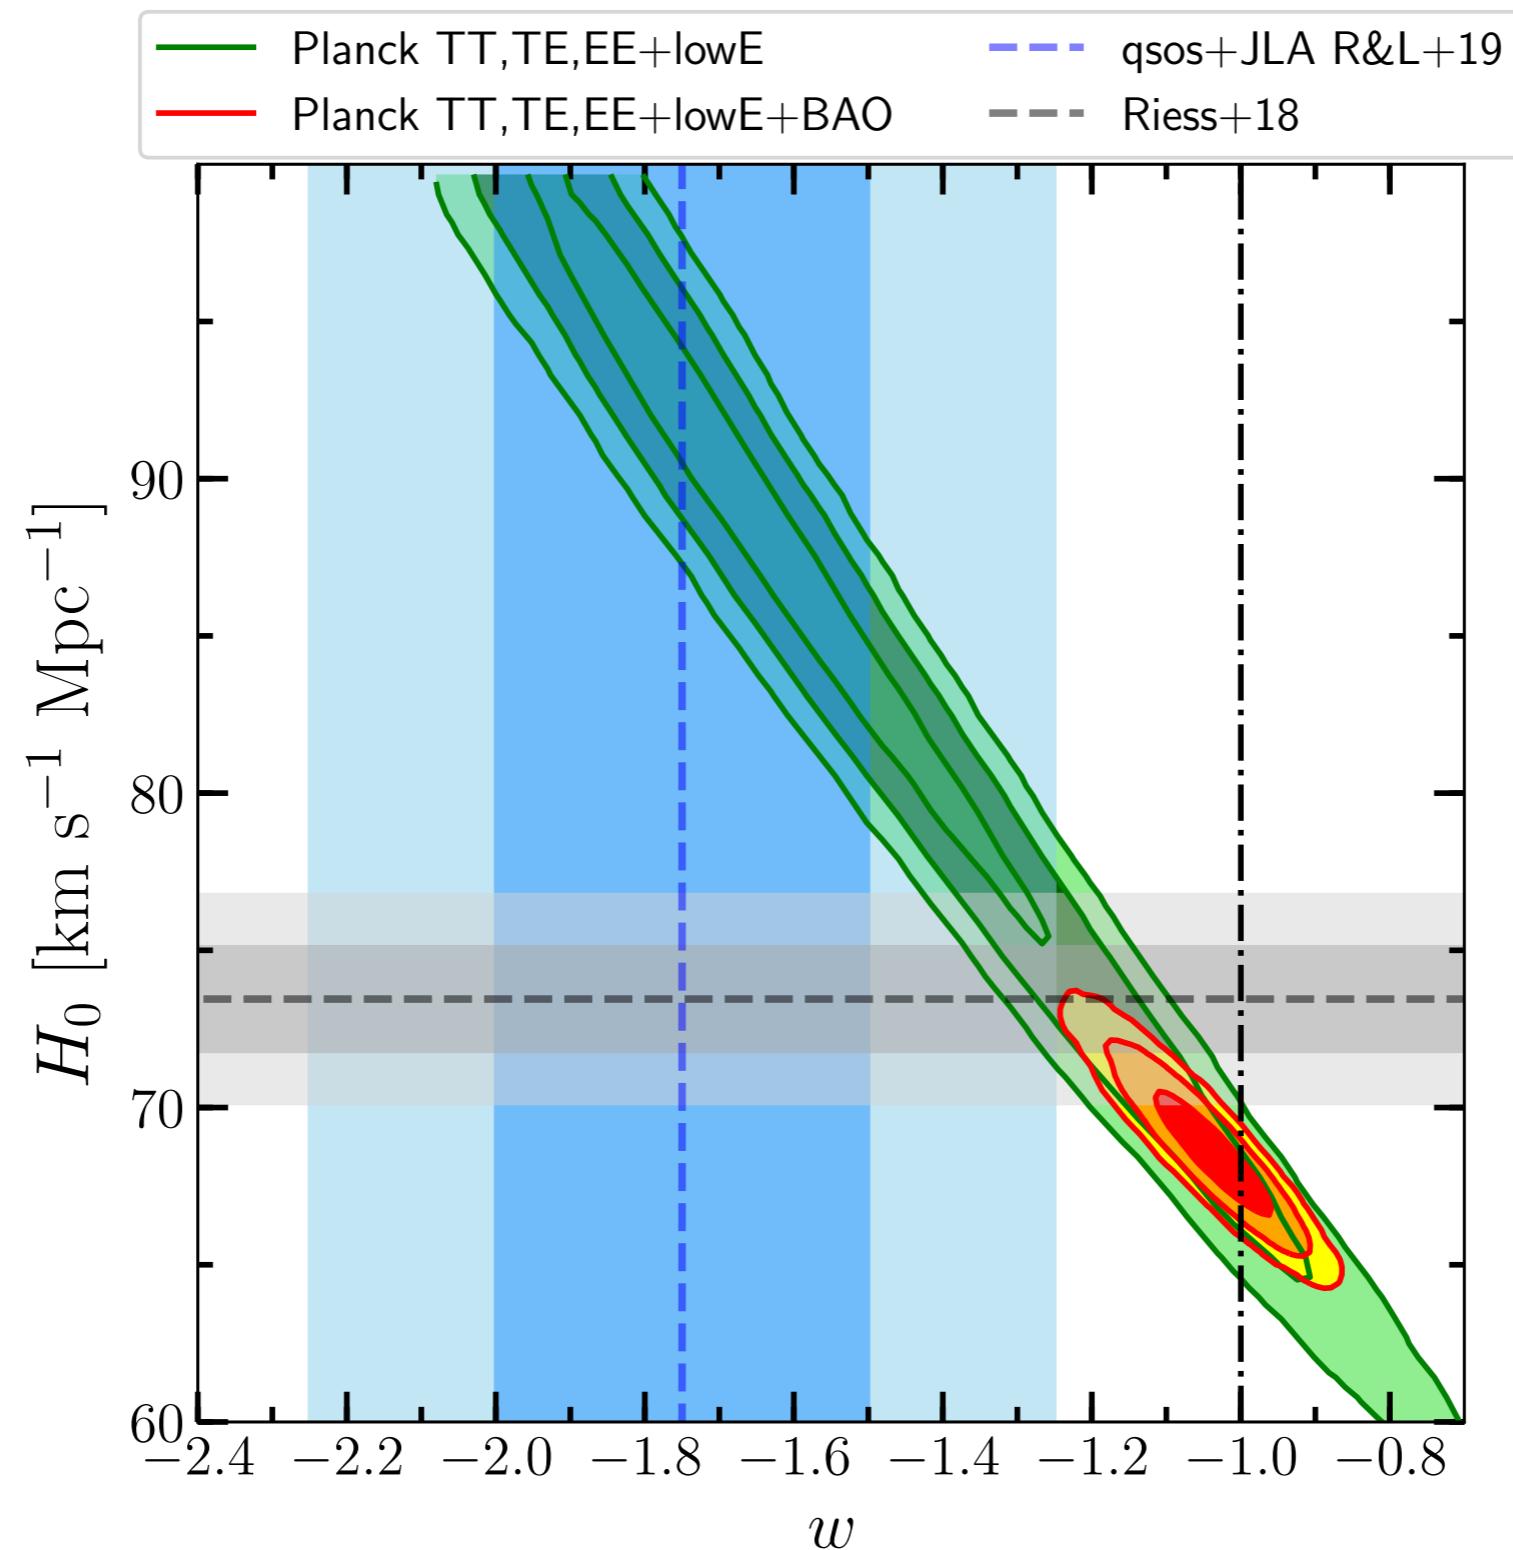

Distance Modulus

Larger acceleration
(growing dark energy)

Redshift

Data suggest: **dark energy density increasing with time**
(i.e. the Universe is accelerating faster than in the past)

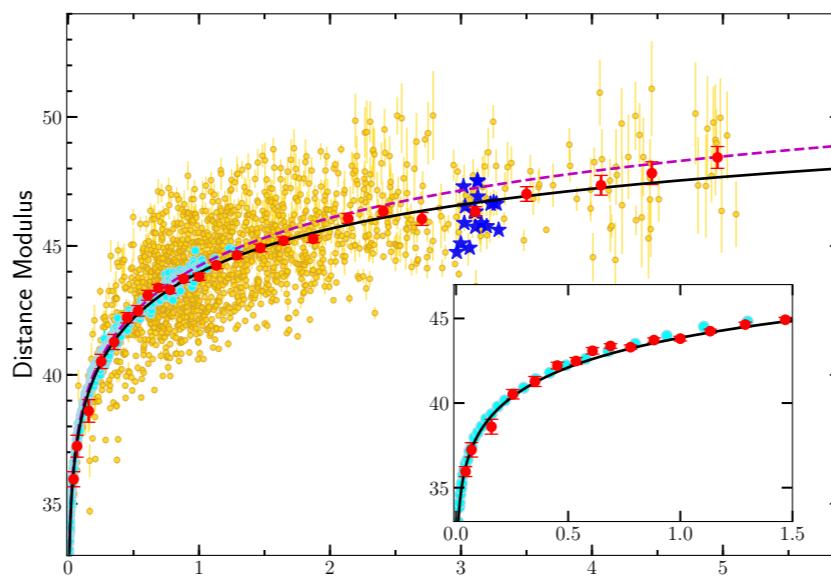

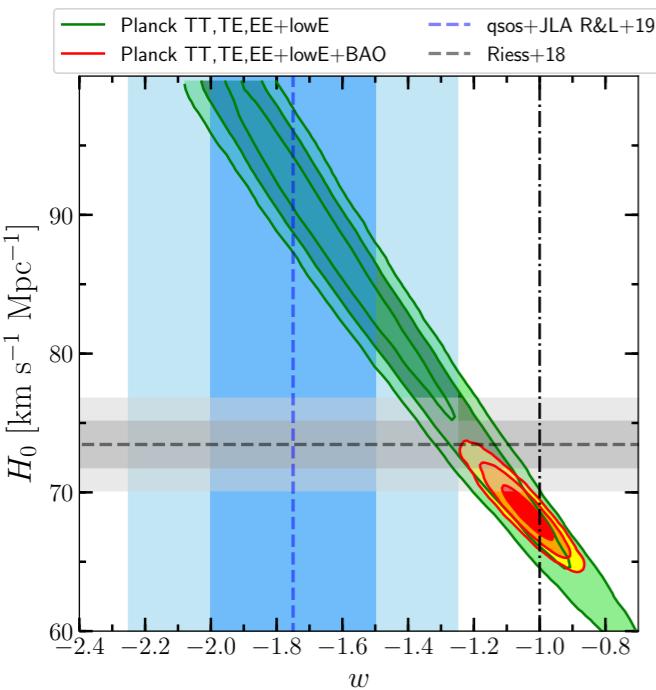

Cosmology with quasars

To summarise

We have a novel way to measure cosmological parameters - Ω_M Ω_Λ $w(z)$ - that uses quasars are standard(izable) candles.

Deviation from the Λ CDM model at high redshift, with a statistical significance of $\sim 4\sigma$
(could “solve” the H_0 tension between local/CMB)
